

## PCM186x 110dB 2ch and 4ch Audio ADCs with Universal Front End

### 1 Features

- Universal Analog Mic Input, 2.1V<sub>RMS</sub> Full Scale
  - 8 Analog Inputs with MUX and PGA
  - Analog pre-mix function before PGA/MUX
  - Single Ended, Pseudo-Differential or Differential Inputs with Mic Bias
  - 4x Digital Microphone Inputs
- Up to 4 Mono ADC channels (PCM1865)
- Hardware Control (PCM1861)
- I<sup>2</sup>C or SPI Control (PCM1863/5)
- H/W Programmable Gain Amplifier
  - Fixed Mic Pregain select : 20, 32dB (Analog)
- S/W Programmable Gain Amplifier
- Integrated High Performance Audio PLL
- Single 3.3V Supply for Analog and Digital
  - Additional 1.8V Core and Interface for lower power consumption
- Power Dissipation at 3.3V: <85mW (PCM1861/3), <145mW (PCM1865)
- 'Energysense' Audio Content Detector - for auto system wakeup and sleep
- Master or Slave Audio Interface:
- Mixer functionality:
  - Digital Mixer to mix ADC outputs and I<sup>2</sup>S synchronous inputs
  - Zero Crossing PGA Gain changes
- Automatic PGA Clipping Suppression control
- PCB-footprint compatibility across all 3 devices

### 2 Applications

- Home Theater and TV
- Automotive Head Units
- *Bluetooth*<sup>®</sup> Speaker
- Microphone Array Processors

### 3 Description

The PCM186x family of audio front-end devices takes a new approach to audio-function integration to ease compliance with European Ecodesign legislation while enabling high-performance end products. With no need for a 5-volt supply or an external programmable-gain amplifier, smaller, smarter products are feasible at reduced cost.

The PCM186x's highly flexible audio front end supports input levels from small-mV microphone inputs to 2.1V<sub>RMS</sub> line inputs without external resistor dividers. The PCM186x family integrates many system-level functions that assist or replace some DSP functions.

All these features are available using a single 3.3V power supply. An integrated bandgap voltage reference provides excellent PSRR, so that a dedicated analog 3.3V rail may not be required.

#### Device Information<sup>(1)</sup>

| ORDER NUMBER | PACKAGE    | BODY SIZE       |
|--------------|------------|-----------------|
| PCM1861      | TSSOP (30) | 7.80mm × 4.40mm |
| PCM1863      |            |                 |
| PCM1865      |            |                 |

(1) For all available packages, see the orderable addendum at the end of this document.

### Simplified Application Diagrams

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.

### Simplified Block Diagrams

### Typ. Performance (3.3V Supply, -1dB FS Input)

| Parameter                          | Performance         |
|------------------------------------|---------------------|
| SNR                                | <110dB              |
| Single Ended Input Dynamic Range   | 106dB               |
| Differential Input Dynamic Range   | 110dB               |
| Differential Input THD+N at -1dBFS | -93dB               |
| Full Scale Input                   | 2.1V <sub>RMS</sub> |
| Normal Group Delay:                | 30/f <sub>S</sub>   |
| Low Latency - Group Delay Latency: | 10/f <sub>S</sub>   |
| Sampling Frequency                 | 32kHz to 192kHz     |

### Device Comparison Table

| PART NUMBER | CONTROL METHOD          | SNR PERFORMANCE    | ANALOG FRONT END  | Simultaneous Channel Capability |
|-------------|-------------------------|--------------------|---|---------------------------------|
| PCM1861     | Hardware                | 110dB Differential | 1 or 2V <sub>RMS</sub> MUX with fixed PGA gains               | 2                               |
| PCM1863     | I <sup>2</sup> C or SPI | 110dB Differential | 1 or 2V <sub>RMS</sub> MUX, Mix, PGA and Aux ADC              | 2                               |
| PCM1865     | I <sup>2</sup> C or SPI | 110dB Differential | 1 or 2V <sub>RMS</sub> MUX, Mix, PGA and Aux ADC, 4 mono ADCs | 4                               |

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision B (March 2014) to Revision C  | Page |
|---|------|
| • Changed "terminal" to "pin" throughout data sheet .....                                 | 1    |
| • Added table note about orderable addendum .....   | 1    |
| • Deleted package designators from part numbers in Device Information table.....          | 1    |
| • Changed "THD+N at - 1dBFS" to "Differential Input THD+N at - 1dBFS" .....               | 2    |
| • Corrected pin numbers in Pin Description table .....                                    | 5    |
| • Corrected pin numbers in Pin Description table - pin 11 is LDO and pin 12 is DGND ..... | 7    |
| • Changed Energysense Accuracy typ from 1dB to 3dB .....                                  | 12   |
| • Changed Secondary ADC Accuracy from 10 bits to 12 bits.....                             | 12   |
| • Added Parameter Measurement Information section. .....                                  | 17   |
| • Added default values for reserved registers.....  | 67   |

---

| Changes from Revision A (March 2014) to Revision B | Page |
|--|------|
| • Added PCM1861 example system diagram .....       | 2    |
| • Updated typical performance table .....          | 2    |
| • Updated Page 3 and Page 253 registers .....      | 67   |

---

| Changes from Revision initial release (March 2014) to Revision A   | Page |
|--|------|
| • Changed from Advance Information to Production Data status ..... | 1    |
| • Deleted "Device Power Dissipation" row .....                     | 9    |

## 5 Pin Configuration and Functions

### 5.1 Pin Assignments, PCM1861

**Figure 1. Device Pin Assignments, PCM1861**

**Table 1. Pin Descriptions, PCM1861**

| PIN         |     | I/O | DESCRIPTIONS  |
|-------------|-----|-----|---|
| NAME        | NO. |     |   |
| VINL2/VIN1M | 1   | I   | Analog input 2, L-channel (or Differential M input for input 1)                           |
| VINR2/VIN2M | 2   | I   | Analog input 2, R-channel (or Differential M input for input 2)                           |
| VINL1/VIN1P | 3   | I   | Analog input 1, L-channel (or Differential P input for input 1)                           |
| VINR1/VIN2P | 4   | I   | Analog input 1, R-channel (or Differential P input for input 2)                           |
| Mic Bias    | 5   | –   | Mic Bias  |
| VREF        | 6   | –   | Reference voltage decoupling (= 0.5 VCC)  |
| AGND        | 7   | –   | Analog GND  |
| AVDD        | 8   | –   | Analog power supply, +3.3V  |
| XO          | 9   | –   | Oscillation amplifier output  |
| XI          | 10  | I   | Oscillation amplifier input   |
| LDO         | 11  | –   | LDO output (or +1.8V input to bypass LDO)   |
| DGND        | 12  | –   | Digital GND   |
| DVDD        | 13  | –   | Digital power supply, +3.3V   |
| IOVDD       | 14  | –   | Power Supply for I/O Voltages (for example, +3.3V or +1.8V)                               |
| SCKI        | 15  | I   | CMOS Level (+3.3V) Master Clock Input   |
| LRCK        | 16  | I/O | Audio data latch enable input/output <sup>(1)</sup>                                       |
| BCK         | 17  | I/O | Audio data bit clock input/output <sup>(1)</sup>  |
| DOUT        | 18  | O   | Audio data digital output   |
| INT         | 19  | O   | Interrupt Output (for Analog Input Detect). Pull High for Active Mode, Pull Low for Idle. |

(1) Schmitt trigger input with internal pull-down (50kΩ typically).

## Pin Assignments, PCM1861 (continued)

**Table 1. Pin Descriptions, PCM1861 (continued)**

| VINR3/VIN3P | 30  | I   | Analog input 3, R-channel (or Differential P input for input 3)                       |

## 5.2 Pin Assignments, PCM1863, PCM1865

A. The DMIN2 option for pin 22 is only available on the PCM1865 device.

**Figure 2. Device Pin Assignments, PCM1863, PCM1865**

**Table 2. Pin Descriptions PCM1863, PCM1865**

| PIN                   |     | I/O | DESCRIPTIONS   |
|-----------------------|-----|-----|--|
| NAME                  | NO. |     |  |
| VINL2/VIN1M           | 1   | I   | Analog input 2, L-channel (or Differential M input for input 1)        |
| VINR2/VIN2M           | 2   | I   | Analog input 2, R-channel (or Differential M input for input 2)        |
| VINL1/VIN1P           | 3   | I   | Analog input 1, L-channel (or Differential P input for input 1)        |
| VINR1/VIN2P           | 4   | I   | Analog input 1, R-channel (or Differential P input for input 2)        |
| Mic Bias              | 5   | –   | Mic Bias   |
| VREF                  | 6   | –   | Reference voltage decoupling (= 0.5 VCC)                               |
| AGND                  | 7   | –   | Analog GND   |
| AVDD                  | 8   | –   | Analog power supply, +3.3V   |
| XO                    | 9   | –   | Oscillation amplifier output (Connect External Crystal if needed here) |
| XI                    | 10  | I   | Oscillation amplifier input (Connect External Crystal if needed here)  |
| LDO                   | 11  | –   | LDO output (or +1.8V input to bypass LDO)                              |
| DGND                  | 12  | –   | Digital GND  |
| DVDD                  | 13  | –   | Digital power supply, +3.3V  |
| IOVDD                 | 14  | –   | Power Supply for I/O Voltages (for example, +3.3V or +1.8V)            |
| SCKI                  | 15  | I   | CMOS Level (+3.3V) Master Clock Input                                  |
| LRCK                  | 16  | I/O | Audio data latch enable input/output <sup>(1)</sup>                    |
| BCK                   | 17  | I/O | Audio data bit clock input/output <sup>(1)</sup>                       |
| DOUT                  | 18  | O   | Audio data digital output  |
| GPIO 3 / INT C        | 19  | I/O | GPIO 3 or Interrupt C  |
| GPIO2 / INT B / DMCLK | 20  | I/O | GPIO 2, Interrupt B or Digital Microphone Clock Output                 |

(1) Schmitt trigger input with internal pull-down (50kΩ typically).

## Pin Assignments, PCM1863, PCM1865 (continued)

**Table 2. Pin Descriptions PCM1863, PCM1865 (continued)**

| PIN                  |     | I/O | DESCRIPTIONS  |
|----------------------|-----|-----|---|
| NAME                 | NO. |     |   |
| GPIO1 / INT-A / DMIN | 21  | I/O | GPIO 1, Interrupt A or Digital Microphone Input   |
| MISO / GPIO0 / DMIN2 | 22  | I/O | <b>SPI-Mode</b> Master In, Slave Out OR <b>I2C-Mode</b> GPIO0, <b>OR DMIN2 (PCM1865 Only)</b> |
| MOSI / SDA           | 23  | I/O | <b>SPI-Mode</b> Master Out, Slave IN OR <b>I2C-Mode</b> SDA                                   |
| MC / SCL             | 24  | I   | <b>SPI-Mode</b> Serial Bit Clock <b>I2C-Mode</b> Serial Bit Clock                             |
| MS / AD              | 25  | I   | <b>SPI-Mode</b> Chip Select OR <b>I2C-Mode</b> Address Pin                                    |
| MD0                  | 26  | I   | Control Method Select Pin: I <sup>2</sup> C (tied low or not connected) or SPI (tied high)    |
| VINL4/VIN4M          | 27  | I   | Analog input 4, L-channel (or Differential M input for input 4)                               |
| VINR4/VIN3M          | 28  | I   | Analog input 4, R-channel (or Differential M input for input 3)                               |
| VINL3/VIN4P          | 29  | I   | Analog input 3, L-channel (or Differential P input for input 4)                               |
| VINR3/VIN3P          | 30  | I   | Analog input 3, R-channel (or Differential P input for input 3)                               |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating temperature range (unless otherwise noted)<sup>(1)</sup>

|                            |               | <b>PCM186x</b>        |
|----------------------------|---------------|-----------------------|
| Supply voltage             | AVDD to AGND  | -0.3V to 3.9V         |
|                            | DVDD to DGND  | -0.3V to 3.9V         |
|                            | IOVDD to DGND | -0.3 V to +3.9V       |
| Ground voltage differences | AGND, DGND    | $\pm 0.3$ V           |
| Digital input voltage      | to DGND       | -0.3 V to IOVDD + 0.3 |
| XI                         | to DGND       | -0.3V to 2.1V         |
| Analog input voltage       | $V_{INXX}$    | -1.7V to 5.0V         |

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 Handling Ratings

|             |                         |   | <b>MIN</b> | <b>MAX</b> | <b>UNIT</b> |
|-------------|-------------------------|---|------------|------------|-------------|
| $T_{stg}$   | Storage Temperature     |   | -40        | 125        | °C          |
| $V_{(ESD)}$ | Electrostatic Discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup> | -4000      | 4000       | V           |
|             |                         | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins   | -1500      | 1500       |             |

(1) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

|                                      |   |             | <b>MIN</b> | <b>NOM</b>  | <b>MAX</b> | <b>UNIT</b> |
|--------------------------------------|---|-------------|------------|-------------|------------|-------------|
| Analog Supply Voltage                | AVDD to AGND  |             | 3.0        | 3.3         | 3.6        | V           |
| Digital Supply Voltage               | DVDD to DGND  |             | 3.0        | 3.3         | 3.6        | V           |
| IO Supply Voltage to DGND            | IOVDD at 1.8V to DGND                                 |             | 1.62       | 1.8         | 1.98       | V           |
| IO Supply Voltage to DGND            | IOVDD at 3.3V to DGND                                 |             | 3.0        | 3.3         | 3.6        | V           |
| LDO to DGND                          | LDO is an input when using external 1.8V power supply | IOVDD – 0.3 | IOVDD      | IOVDD + 0.3 | V          |             |
| Operating Junction Temperature Range |   | -40         |            |             | 125        | °C          |

### 6.4 THERMAL CHARACTERISTICS

over operating temperature range (unless otherwise noted)

| <b>PARAMETER</b> |          | <b>TEST CONDITIONS</b> | <b>MIN</b> | <b>TYP</b> | <b>MAX</b> | <b>UNIT</b> |
|------------------|----------|------------------------|------------|------------|------------|-------------|
| $R_{thJA}$       | Theta JA | High K                 |            | 91.2       |            | °C/W        |
| $\Psi_{JT}$      | Psi JT   |                        |            | 1.0        |            |             |
| $\Psi_{JB}$      | Psi JB   |                        |            | 41.5       |            |             |
| $R_{thJC}$       | Theta JC | Top                    |            | 25.3       |            |             |
| $R_{thJB}$       | Theta JB |                        |            | 42.0       |            |             |

## 6.5 Electrical Characteristics, DC

all specifications at  $T_A = 25^\circ\text{C}$ , AVDD = 3.3V, DVDD = 3.3V, IOVDD = 3.3V, Master Mode, Single Speed Mode,  $f_S = 48\text{kHz}$ , system clock =  $256 \times f_S$ , 24-bit data (unless otherwise noted)

| PARAMETER                                | TEST CONDITIONS  | MIN              | TYP | MAX | UNIT   |
|--|--|------------------|-----|-----|--------|
| <b>Power</b>                             |  |                  |     |     |        |
| 3.3V AVDD Current                        | 2ch 48kHz, XTAL Master Mode                                    | 16               |     |     | mA     |
| 3.3V AVDD Current                        | 4ch, 48kHz, Slave mode   | 31               |     |     | mA     |
| 3.3V DVDD Current                        | 2ch 48kHz, XTAL Master Mode                                    | 10               |     |     | µA     |
| 3.3V DVDD Current                        | 4ch 48kHz, XTAL Master Mode                                    | 10               |     |     | µA     |
| 1.8V DVDD Current                        | DVDD=1.8V, 2ch, 48kHz, XTAL                                    | 10               |     |     | µA     |
| PSRR                                     | Valid with recommended values on Analog Rails (AVDD, VREF etc) | 80               |     |     | dB     |
| Power Consumption                        | 48kHz 2ch Active 3.3V source for all                           | 80               |     |     | mW     |
| Power Consumption                        | 48kHz Sleep (Energysense) 3.3V source for all                  | 24               |     |     | mW     |
| Power Consumption                        | 48kHz Standby 3.3V source for all                              | 0.59             |     |     | mW     |
| Power Consumption                        | 48kHz 4ch Active 3.3V source for all                           | 145              |     |     | mW     |
| 3.3V AVDD Current                        | 2ch 48kHz with XTAL - Sleep Mode                               | 2.7              |     |     | mA     |
| 3.3V AVDD Current                        | 2ch 48kHz with XTAL - Standby Mode                             | 17.1             |     |     | mA     |
| 3.3V AVDD Current                        | 2ch 48kHz with XTAL - Powerdown Mode                           | 1.2              |     |     | mA     |
| 3.3V DVDD Current                        | 3.3V DVDD 2ch Mode, 48kHz, Master Mode - Sleep Mode            | 353              |     |     | µA     |
| 3.3V DVDD Current                        | 3.3V DVDD 2ch Mode, 48kHz, Master Mode - Standby Mode          | 353              |     |     | µA     |
| 3.3V DVDD Current                        | 3.3V DVDD 2ch Mode, 48kHz, master mode - Powerdown             | 353              |     |     | µA     |
| 1.8V DVDD Current                        | DVDD=1.8V, 2ch, 48kHz, XTAL.-Sleep Mode                        | 384              |     |     | µA     |
| 1.8V DVDD Current                        | DVDD=1.8V, 2ch, 48kHz, XTAL.-Powerdown                         | 384              |     |     | µA     |
| 1.8V DVDD Current                        | DVDD=1.8V, 2ch, 48kHz, XTAL. Powerdown                         | 384              |     |     | µA     |
| Power Consumption (3.3V AVDD, 1.8V DVDD) | 48kHz 2ch Active 3.3V analog, 1.8V digital                     | 68               |     |     | mW     |
| Power Consumption (3.3V AVDD, 1.8V DVDD) | 48kHz 4ch Active 3.3V analog, 1.8V digital                     | 128              |     |     | mW     |
| 3.3V AVDD Current                        | 4ch, 48kHz, Master mode  | 31               |     |     | mA     |

## 6.10 I<sup>2</sup>C Control Interface Timing Requirements

| PARAMETER    |   | CONDITIONS | MIN           | MAX         | UNIT    |
|--------------|---|------------|---------------|-------------|---------|
| $f_{SCL}$    | SCL clock frequency   | Standard   | 100           | 400         | kHz     |
|              |   | Fast       |               | 400         | kHz     |
| $t_{BUF}$    | Bus free time between a STOP and START condition                                      | Standard   | 4.7           |             | $\mu s$ |
|              |   | Fast       | 1.3           |             |         |
| $t_{LOW}$    | Low period of the SCL clock   | Standard   | 4.7           |             | $\mu s$ |
|              |   | Fast       | 1.3           |             |         |
| $t_{HI}$     | High period of the SCL clock  | Standard   | 4.0           |             | $\mu s$ |
|              |   | Fast       | 600           |             |         |
| $t_{RS-SU}$  | Setup time for (repeated) START condition   | Standard   | 4.7           |             | $\mu s$ |
|              |   | Fast       | 600           |             |         |
| $t_{S-HD}$   | Hold time for (repeated) START condition  | Standard   | 4.0           |             | $\mu s$ |
|              |   | Fast       | 600           |             |         |
| $t_{D-SU}$   | Data setup time   | Standard   | 250           |             | $\mu s$ |
|              |   | Fast       | 100           |             |         |
| $t_{D-HD}$   | Data hold time  | Standard   | 0             | 900         | $\mu s$ |
|              |   | Fast       | 0             | 900         |         |
| $t_{SCL-R}$  | Rise time of SCL signal   | Standard   | $20 + 0.1C_B$ | 1000        | $\mu s$ |
|              |   | Fast       | $20 + 0.1C_B$ | 300         |         |
| $t_{SCL-R1}$ | Rise time of SCL signal after a repeated START condition and after an acknowledge bit | Standard   | $20 + 0.1C_B$ | 1000        | $\mu s$ |
|              |   | Fast       | $20 + 0.1C_B$ | 300         |         |
| $t_{SCL-F}$  | Fall time of SCL signal   | Standard   | $20 + 0.1C_B$ | 1000        | $\mu s$ |
|              |   | Fast       | $20 + 0.1C_B$ | 300         |         |
| $t_{SDA-R}$  | Rise time of SDA signal   | Standard   | $20 + 0.1C_B$ | 1000        | $\mu s$ |
|              |   | Fast       | $20 + 0.1C_B$ | 300         |         |
| $t_{SDA-F}$  | Fall time of SDA signal   | Standard   | $20 + 0.1C_B$ | 1000        | $\mu s$ |
|              |   | Fast       | $20 + 0.1C_B$ | 300         |         |
| $t_{P-SU}$   | Setup time for STOP condition   | Standard   | 4.0           |             | $\mu s$ |
|              |   | Fast       | 600           |             |         |
| $C_B$        | Capacitive load for SDA and SCL line  |            |               | 400         | pF      |
| $t_{SP}$     | Pulse width of spike suppressed   | Fast       |               | 50          | ns      |
| $V_{NH}$     | Noise margin at High level for each connected device (including hysteresis)           |            |               | $0.2V_{DD}$ | V       |

Figure 3. I<sup>2</sup>C Control Interface Timing

## 6.11 SPI Control Interface Timing Requirements

| PARAMETERS |                            | MIN | MAX | UNITS |
|------------|----------------------------|-----|-----|-------|
| $t_{MCY}$  | MC Pulse Cycle Time        | 100 |     | ns    |
| $t_{MCL}$  | MC Low Level Time          | 40  |     | ns    |
| $t_{MCH}$  | MC High Level Time         | 40  |     | ns    |
| $t_{MHH}$  | High Level Time            | 20  |     | ns    |
| $t_{MSS}$  | Fall Edge to MC Rise Edge  | 30  |     | ns    |
| $t_{MSH}$  | Hold Time <sup>(1)</sup>   | 30  |     | ns    |
| $t_{MDH}$  | MOSI Hold Time             | 15  |     | ns    |
| $t_{MDS}$  | MOSI Set-up Time           | 15  |     | ns    |
| $t_{MOS}$  | MC Rise Edge to MDO Stable | 20  |     | ns    |

Input = -1dBFS      Input at 1kHz

Figure 8. Dynamic Range versus Supply Voltage

Figure 9. THD+N versus Supply Voltage

Figure 10. Power Consumption versus Sample Rate

## Typical Characteristics (continued)

all specifications at  $T_A = 25^\circ\text{C}$ , AVDD = 3.3V, DVDD = 3.3V, IOVDD = 3.3V, Master Mode, Single Speed Mode,  $f_S = 48\text{kHz}$ , system clock =  $256 \times f_S$ , 24-bit data (unless otherwise noted)

## Typical Characteristics (continued)

all specifications at  $T_A = 25^\circ\text{C}$ , AVDD = 3.3V, DVDD = 3.3V, IOVDD = 3.3V, Master Mode, Single Speed Mode,  $f_S = 48\text{kHz}$ , system clock =  $256 \times f_S$ , 24-bit data (unless otherwise noted)

Figure 17. Linearity, Input versus Output

## 7 Parameter Measurement Information

Figure 18. PCM186x Test Circuit

All typical characteristics for the devices are measured using the EVM and an Audio Precision SYS-2722 Audio Analyzer. A PSIA interface is used to allow the I2S interface to be driven directly into the SYS-2722.

## 8 Detailed Description

### 8.1 Overview

- Advanced Clocking support
  - External XTAL support for Master Mode
  - External CMOS Master Clock Support for Master Mode
  - Integrated PLL for generating audio clocks from any BCK/MCK Source.
  - Device can output Audio Master Clock when running from Non-Audio Master Clock, for use with other converters. Device must be in Master mode for this function.
  - BCK PLL available to avoid using External SCK
  - Clock (SCK, BCK, LRCK) Error Detection with Smart Mute
  - BIT Clock (BCK) for PLL Reference:  $48 \times f_S$  or

$64 \times f_S$  ( $32 \times f_S$  support in software controlled devices)

- Secondary ADC can be used for control signals
  - Measure External DC voltages such as control potentiometers
  - Generate Interrupts on programmable thresholds
- Extensive Interrupt Sources

### 8.2 Functional Block Diagram

An internal block diagram of the PCM186x family is shown below. Note that power supplies and references have been omitted from this diagram to aid simplicity.

Figure 19. Internal Block Diagram of the PCM186x

### 8.3 Terminology

Control registers in this datasheet are given by **REGISTER BIT/BYTE NAME (Page.x HEX ADDRESS)**. SE refers to "Single Ended" analog inputs, DIFF refers to "Differential" analog inputs. SCK (System Clock) and MCLK (Master Clock) are used interchangeably. Sampling frequency is symbolized by " $f_S$ ". Full scale is symbolized by "FS". Sample time as a unit is symbolized by " $t_S$ ".

## 8.4 Analog Front End

**Figure 20. High Level View of PCM186x Front End Circuitry**

The PCM186x has a universal front end that accepts differential or single-ended inputs, from microphone level to  $2.1V_{RMS}$ . The highest performance (up to 110dB SNR) can be achieved using differential inputs.

The front-end Mix and MUX circuit allows both differential and single-ended inputs to be used in the products, as well as direct Input mixing. This feature is mainly enabled on the software-controlled devices, while the hardware-controlled devices support single-ended or differential inputs. The Mix and MUX circuits are summing circuits, done pre-PGA. No individual volume controls are available before the PGA.

DC blocking capacitors are required on the inputs, to ensure that the DC bias conditions are known (assumed to be GND, but **not** certain). Also, the value of the output short-circuit protection resistor in the source product is not known, which could cause issues such as gain error and DC shift.

## 8.5 Microphone Support

The PCM186x supports analog and digital microphones. Analog signals are treated in much the same way as line-level signals, except for the requirement for mic bias. Digital microphone Inputs (PDM inputs) use GPIOs on the device. Two-channel ADC variants of the PCM186x family can support two digital microphones using a single data pin and a single clock pin. The 4-channel variants can support up to 4 digital microphones (2 data pins).

Three gain choices are available in the PCM1861, controlled by pins MD2, MD5 and MD6; 0dB, 12dB, or 32dB.

The PCM186x software programmable devices support electret condenser mics through a mic bias circuit and a PGA input providing up to 32dB of gain.

Digital microphones typically have a PDM output that can be brought into an ADC digital decimation filter. PDM microphones require power and a clock. Power should be handled from an external source.

Digital microphone mode Gain can be added in the digital PGA and in the mixer. The Maximum gain is 30dB (18dB in the mixer + 12dB in the digital PGA).

On the PCM1865, a 2-channel digital mic + 2-channel ADC mode is possible. With the PCM1863, four channels are only possible with a ADC + I<sup>2</sup>S input configuration.

### 8.5.1 Mic Bias

The PCM186x can provide a microphone bias to power and bias microphones at 2.6V on pin 5. Mic Bias should be decoupled/filtered with an external capacitor. Mic Bias is typically used with a electret microphone. An on-chip series resistor can be bypassed using register **MIC\_BIAS\_CTRL (Page.3, 0x15)**. By default, the device is configured to bypass the on-chip resistor.

## Microphone Support (continued)

Figure 21. On-Chip Mic Bias Resistor Bypassed  
(Default)

Figure 22. On-Chip Mic Bias Resistor In Use

## 8.6 PCM1861 Input Multiplexer

The hardware controlled devices can support a wide gain range using the MD2, MD5 and MD6 configuration pins as follows:

**Table 3. Channel and Gain Selection for Hardware Controlled Devices**

| MD6 | MD5 | MD2 | ADC1_L / PGA1_L           | ADC1_R / PGA1_R           |
|-----|-----|-----|---------------------------|---------------------------|
| L   | L   | L   | S.E - VINL1 / 0 dB        | S.E - VINR1 / 0 dB        |
| L   | L   | H   | S.E - VINL2 / 0 dB        | S.E - VINR2 / 0 dB        |
| L   | H   | L   | S.E - VINL3 / 0 dB        | S.E - VINR3 / 0 dB        |
| L   | H   | H   | S.E - VINL4 / 0 dB        | S.E - VINR4 / 0 dB        |
| H   | L   | L   | S.E - VINL4 / 12 dB       | S.E - VINR4 / 12 dB       |
| H   | L   | H   | S.E - VINL4 / 32 dB       | S.E - VINR4 / 32 dB       |
| H   | H   | L   | DIFF(VIN1P/VIN1M) / 0 dB  | DIFF(VIN2P/VIN2M) / 0 dB  |
| H   | H   | H   | DIFF(VIN3P/VIN3M) / 12 dB | DIFF(VIN4P/VIN4M) / 12 dB |

## 8.7 PCM1863/5 Mixers and Multiplexers

The PCM186x software programmable devices offer a mix/multiplex level of functionality on the front end as shown in [Figure 20](#). The switches integrated into the multiplexer can also be switched on in parallel, offering a direct mix of inputs. This function can be selected by register for each ADC input selection, **ADCX1\_INPUT\_SEL\_X (Page.0, 0x06 → 0x09)**. In single ended mode, each Audio ADC is tightly coupled to a dedicated PGA and MUX. ADC1L (and ADC2L on the PCM1865) is connected a mux that has input pins VINL<sub>x</sub>, (x = 1 to 4). ADC1R (and ADC2R on the PCM186) is connected to a mux that has input pins VINR<sub>x</sub> (x = 1 to 4).

Mixing between the left channels of stereo pairs is possible in the mux dedicated to ADC1L and right channels of stereo pairs in the mux dedicated to ADC1R. In addition, polarity of the inputs can be inverted using the MSB of the select register. Mixing left and right sources to create mono mixes can only be done in the digital mixer, post ADC conversion, or alternatively, other analog inputs can be connected for mixing.

The examples available are below - where [SE] is single ended, and [DIFF] is a differential input. Bold items are the single channel selects.

**Table 4. MUX, Mix and Polarity Input Selection**

| Register Code | ADC1L and ADC2L                               | ADC1R and ADC2R                               |
|---------------|---|---|
| 0x00          | No Selection (Mute)                           | No Selection (Mute)                           |
| <b>0x01</b>   | <b>VINL1[SE] (Default)</b>                    | <b>VINR1[SE] (Default)</b>                    |
| <b>0x02</b>   | <b>VINL2[SE]</b>                              | <b>VINR2[SE]</b>                              |

## 8.8 Programmable Gain Amplifier

The PCM186x has a two-stage programmable gain amplifier (PGA). Coarse gain adjustment is done in the analog domain, whilst fine gain adjustment is done in the digital domain. The  $\pm 12\text{dB}$  Analog gain steps are designed for varying line level inputs, whilst the  $+20\text{dB}$  and  $+32\text{dB}$  are primarily designed for microphone inputs, which will likely need additional gain that can be done in the digital domain. The analog gain steps between  $-12\text{dB}$  and  $+12\text{dB}$  are in  $1\text{dB}$  steps. Half  $\text{dB}$  steps between those points are done in the digital PGA. Gain steps between  $12\text{dB}$  and  $20\text{dB}$  are all done in the digital domain. (for example,  $18\text{dB}$  gain =  $12\text{dB}$  analog +  $6\text{dB}$  Digital). The gain structure in the PCM186x is shown below.

**Figure 23. PCM186x Complete Gain Structure (PGAs and Attenuator)**

The analog gain steps within the analog PGA are shown below. Again, from  $-12\text{dB}$  to  $+12\text{dB}$ , the steps are  $1\text{dB}$  each. The digital PGA has granularity down to  $0.5\text{dB}$ .

**Figure 24. Analog Gain Steps with PCM186x Software Programmable Devices**

The PGA in the PCM186x is a hybrid analog and digital programmable gain amplifier. The devices integrate a lookup table with the optimal gain balance between analog and digital gain, allowing the gain to be set in a single register per channel. For example, set  $18\text{dB}$  Gain, and the system will allocate  $12\text{dB}$  to the analog PGA and  $6\text{dB}$  to the digital.

The PGA is a zero crossing detect type, and has the ability to set target gain, and have the device work towards it (with a timeout if there is no zero crossing). Any changes in the Analog PGA and Digital PGA are designed to step towards the final level. However, any changes in the Mixer PGA are immediate. Care should be taken when changing gain levels in the digital mixer PGA. Alternatively, multiple writes can be made of small enough values that will not cause significant pops/clicks.

For example, Current level  $0\text{dB}$ , set target as  $3.5\text{dB}$  – PGA increases gain in  $0.5\text{dB}$  steps towards  $3.5\text{dB}$ .

The Auto Gain Mapping function can be bypassed if required, using Manual Gain Mapping. Manual Gain Mapping is particularly useful when using digital microphones, as the PDM input signal bypasses the analog PGA and must be amplified using the digital PGA. (**PGA\_MODE Register (Page.0, 0x19)**)

### NOTE

Using the device with a differential signal lowers the PGA gain by  $6\text{dB}$ . Designers should account for this in their software, the PCM186x does not compensate for this.

Differential Analog Gain points are  $-18$  to  $6\text{dB}$ ,  $14\text{dB}$ ,  $26\text{dB}$ .

## 8.9 Automatic Clipping Suppression

The PCM186x software controlled devices have the ability to automatically lower the gain in  $0.5\text{dB}$  steps under the following conditions if the ADC is clipping.

The device detects clipping after the decimation filter in the signal chain (shown in [Figure 25](#)), and counts the number of successive clips before responding.

The device can also generate an internal interrupt that can be mapped to a GPIO or interrupt pin, allowing the system microcontroller to make the decision to increase the gain and consider the clipping an isolated event, or make the decision that the new gain setting is appropriate.

## Automatic Clipping Suppression (continued)

**Figure 25. Sampling points within the PCM186x for Auto Clipping Suppression**

### Maximum Attenuation Level

This feature is not designed to be a complete analog gain control. This feature was defined to avoid clipping, and to inform the system microcontroller of a clipping event, to allow the microcontroller (or the end user) to decide if the gain should be increased again.

The maximum attenuation is programmable to be -3 / -4 / -5 / -6 dB.

### Channel Linking

Depending on the application, users may not want to link input channels, however, for the majority of Stereo input applications, it's strongly recommended to set the system to track gain across inputs, to maintain balance.

The Auto PGA Clipping Suppression Control has the following settings:

**Table 5. Auto Clipping Suppression Control Registers**

| Register Name | Register Location | Usage   | Values   |
|---------------|-------------------|---|--|
| AGC_EN        | Pg0 0x05          | Enable Auto Gain Control.   | 0: Disable (Default)<br>1: Enable  |
| CLIP_NUM[1:0] | Pg0 0x05          | Start auto gain control after detects CLIP_NUM times of ADC sample clips  | 0: 80<br>1: 40<br>2: 20<br>3: 10 (Default)   |
| MAX_ATT[1:0]  | Pg0 0x05          | Maximum automatic attenuation   | 0: -3dB (Default)<br>1: -4dB<br>2: -5dB<br>3: -6dB                                   |
| DPGA_CLIP_EN  | Pg0 0x05          | Enable Clipping detection after the digital PGA. Note, digital PGA is post ADC, meaning that there will be a short delay before clipping is detected. | 0: Disable (Default)<br>1: Enable  |
| LINK          | Pg0 0x05          | Link all channels together. Should be linked if dealing with stereo sources to maintain balance.  | 0: Independent control (Default)<br>1: Ch1[R]/Ch2[L]/Ch2[R] follow Ch1[L] PGA value. |
| SMOOTH        | Pg0 0x05          | Enable Smooth transition from step to step. (zero crossing)   | 0: Immediate Change<br>1: Smooth Change (Default)                                    |

## 8.10 Zero-Crossing Detect

The PCM186x uses a zero crossing detector to make gain changes only when the incoming signal crosses its halfway point between negative and positive swing, reducing "zipper noise".

There are two sources for the controller, the output of the ADC Modulator and the output from the digital PGA. The Analog PGA is sampled at 4 $\times$  the audio sampling rate to detect the zero crossing. The digital PGA is sampled at a similar rate.

The process for changing gain in the PCM186x is as follows:

1. Detect a zero crossing of the oversampled analog input channel.
2. Increment or Decrement the gain toward the target PGA value step by 0.5dB.
3. Repeat from (1) until arrival at the target PGA value.
4. If zero crossing does not occur for 8192 sample times (= time out), change the gain per sample.

This process does not require intervention by the user. This data serves as information only.

## 8.11 Digital Inputs

### 8.11.1 Stereo PCM Sources

The PCM186x can support Stereo PCM data on GPIO pins so that I<sup>2</sup>S sources, such as wireless modules can have their data mixed with the incoming analog content. The clock rate of the incoming data (known as DIN) must be synchronous with the PCM186x software programmable device main clocks. There is no integrated sample rate converter on-chip. The DIN signal can be received on GPIO0,1,2,3, configured on **GPIO\_FUNC\_X (Page.0 0x10 and 0x11)**. The incoming data is then driven to the digital mixer running on DSP2.

The audio format can be configured separately from the output serial port using register **RX\_TDM\_OFFSET (P0, 0x0E)**.

Inputs can be mixed and volume-controlled before routing to a digital amplifier. Typical uses could be the connection to a *Bluetooth* module. The mixing and crossfading could be done all in the PCM186x, rather than a hard switch in external logic. The on-chip PLL can also help create the system master clock (SCKOUT) for poorly designed I<sup>2</sup>S *Bluetooth* modules that don't provide an system clock to drive the system DACs.

## 8.12 Digital PDM Microphones

Up to four digital microphones are supported on the PCM1865, using a shared output clock (configured from GPIO2) and two data lines, GPIO0 or GPIO1. Two digital microphones are supported on the PCM1863, mainly using GPIO1 as the data input. The PCM1861 does not support digital microphones. The typical connection and protocol diagrams for these microphones are shown in [Figure 26](#) and [Figure 27](#).

**Figure 26. Digital Microphone Example Connection**

**Figure 27. Digital Microphone Protocol**

Supported Digital Microphone clock frequency is as follows, and the frequency depends on required operating sampling frequency as follows:

- 2.0480MHz (32kHz × 64)
- 2.8224MHz (44.1kHz × 64)
- 3.072MHz (48kHz × 64)
- 3.072MHz (96kHz × 32 )

The Recommended operating conditions for the Digital MIC to get good performance are:

- Sampling frequency is 32kHz or 44.1kHz
- SCK is 256 $f_S$ .
- Enable Auto Clock Detector (Default)

## 8.13 Clocks

### 8.13.1 Description

The PCM186x family has an extremely flexible clocking architecture. All converters require a Master Clock (typically a  $2^n$  power of the sampling rate, known as MCK), a bit clock (BCK) which is used to clock the data bit by bit out of the device (typically running at  $64f_S$  - to allow up to 32bits per channel output) and finally a Wordclock/Left-Right Clock (LRCK) that is used to set the exact sampling point for the ADC.

The PCM186x family can be a clock master (where BCK and LRCK can be internally divided from a provided master clock) or can be a clock slave, where all clocks (MCK, BCK and LRCK) must be provided by an external source.

Unlike many competing devices, the PCM186x family can source its master clock from two different sources, either an external crystal, or a CMOS level (3.3V or 1.8V) clock, eliminating the usual external crystal oscillator circuit required to source a CMOS clock signal.

The PCM186x also differentiates itself by integrating an on-chip Phase Locked Loop (PLL) that can generate real audio-rate clocks from any clock source between 1MHz and 50MHz. The PCM1861 hardware-controlled devices have the ability to detect an absence of MCK in Slave Mode and automatically generate a MCK signal. Software Controlled devices, such as the PCM1863/5 can have their PLL programmed to generate audio clocks based on any incoming clock rate. For example, a 12MHz clock in the system can be used to generate clocks for a 44.1kHz system.

### 8.13.2 External Clock-Source Limits

The 3 different clock sources for the device each have some limits in terms of their input circuitry. These limits are separate from the internal PLL capability.

**Table 6. External Clock-Source Limitations and notes**

| Clock Source   | Limits        | Notes  |
|----------------|---------------|--|
| XTAL           | 15MHz → 35MHz |  |
| 3.3V CMOS MCLK | 1MHz → 50MHz  | Should be input to SCKI pin. 3.3V CMOS can be input, even when IOVDD is 1.8V |
| 1.8V CMOS MCLK | 1MHz → 50MHz  | Should be input to XI pin.   |

### 8.13.3 Device Clock Distribution and Generation

**Figure 28. PCM186x Main Audio Clock Tree and Clock Generation**

PLLs are used in all modes to generate the clocks required to run both fixed-function DSPs. The dividers are automatically configured based on the clock rate detection. The clock architecture above allows non-audio clock sources to be used as clock sources and the PCM186x to continue to run in a Master mode, providing all PCM/I<sup>2</sup>S Clocks for other converters in the system.

### 8.13.4 PCM186x Clocking Modes

There are four different clocking modes available on the device which can take advantage of the onboard PLL and clock detection. Advanced clock detection and a smart internal state engine in the PCM186x can automatically configure the various dividers in the device (shown in [Device Clock Distribution and Generation](#)) with optimized values. Automatic clock configuration is enabled by default, using the register **CLKDET\_EN** ([Page.0, 0x20](#)).

| NAME               | Device      | External XTAL/MCK INPUT | BCK, LRCK Direction | PLL Configuration                  |
|--------------------|-------------|-------------------------|---------------------|------------------------------------|
| ADC Master Mode    | PCM1861/3/5 | YES                     | OUT                 | Not Required                       |
| ADC Slave Mode     | PCM1861/3/5 | YES                     | IN                  | Not Required                       |
| ADC Slave PLL Mode | PCM1863/5   | NO                      | IN                  | Automatic for standard audio rates |
| ADC Non-Audio MCK  | PCM1863/5   | YES                     | OUT                 | Manual                             |

#### 8.13.4.1 PCM1861 Clock Configuration and selection

The PCM186x offers both Master and Slave functionality. In master mode, a source master clock (of 256, 384 or 512x the sampling rate) can be sourced from either an external crystal (XI/XO) or on an incoming SCK. (see [External Clock-Source Limits](#) for input rate limitations on SCK sources) The clock from XI and SCK are OR'd internally, allowing either to be used.

The device can generate the other I<sup>2</sup>S clocks (BCK and LRCK) in master mode (with dividers set in MD0 and MD1) or be a clock slave to MCK,BCK and LRCK. In this scenario, the device auto-detects the clock divider ratio.

In master mode, BCK per LRCK is fixed at 64. This allows up to 32 bits per channel.

Selection of the appropriate master/slave and clock ratio between MCK and f<sub>S</sub> can be done using MD0 and MD1.

[Table 7](#) shows the suggested master clock rates for each of the sample rates supported.

**Table 7. External Master Clock Rate versus Sampling Frequency**

| SAMPLING RATE FREQUENCY<br>(kHz) | SYSTEM CLOCK FREQUENCY (MHz) |                   |                   |
|----------------------------------|------------------------------|-------------------|-------------------|
|                                  | 256f <sub>S</sub>            | 384f <sub>S</sub> | 512f <sub>S</sub> |
| 8.0                              | 2.048                        | 3.072             | 4.096             |
| 16.0                             | 4.096                        | 6.144             | 8.192             |
| 32.0                             | 8.1920                       | 12.2880           | 16.3840           |
| 44.1                             | 11.2896                      | 16.9344           | 22.5792           |
| 48.0                             | 12.2880                      | 18.4320           | 24.5760           |
| 64.0                             | 16.3840                      | 24.5760           | 32.7680           |
| 88.2                             | 22.5792                      | 33.8688           | 45.1584           |
| 96.0                             | 24.5760                      | 36.8640           | 49.1520           |
| 176.4                            | 45.1584                      |                   |                   |
| 192.0                            | 49.1520                      |                   |                   |

For slave mode, BCK per LRCK should be set to 64.

#### 8.13.4.2 Clock Sources (PCM186x Software Programmable Devices)

The PCM186x devices support a wide range of options for generating the clocks required to operate the ADC section, as well as interface and other control blocks as shown in [Figure 29](#).

The clocks for the PLL require a source reference clock. This clock source can be configured on software devices as the XTAL, SCK or BCK.

The PCM186x software programmable devices share a similar clock tree for the generation and distribution of clocks [Figure 28](#).

**CLK\_MODE (Page.0 0x20)** is used to configure the clock configuration. Bits [5:7] configure the OR and MUX for the incoming MCLK.

Register **MST\_MODE (Page.0 0x20)** is used to set the device in Master or Slave Mode. Bits [1:3] set clock sources for the ADC, DSP1 and DSP2. These can mostly be ignored for the most common applications, but are provided for advanced users.

The **CLKDET\_EN (Page.0, 0x20)** register bit (Auto Clock Detector) is important; the clock detector is mainly functional for slave modes, and for master modes where the master clock is a 256/384/512x multiple of the incoming data rate.

#### NOTE

Non audio related master clock sources can be used with the PCM186x software programmable devices providing the PLL is programmed manually. CLKDET\_EN should be set to 0.

The result of configurations can be checked by reading registers **FS\_INFO / CURRENT\_BCK\_RATIO (Page.0 0x73 and 0x74)**.

**Table 8. PLL Configuration Registers**

| CLOCK MULTIPLEXER | FUNCTION                            | BITS                  |
|-------------------|-------------------------------------|-----------------------|
| MST_SCK_SRC       | PLL Reference                       | Page 0, Register 0x20 |
| DIVIDER           | FUNCTION                            | BITS                  |
| CLK_DIV_PLL_SCK   | Clock Divider of PLL to emulate SCK | Pg0, Reg 0x25, b[0:6] |
| CLK_DIV_MST_SCK   | Master Mode SCK to SCKOUT Ratio     | Pg0, Reg 0x26, b[0:6] |
| CLK_DIV_MST_BCK   | Master Mode SCK to BCK Ratio        | Pg0, Reg 0x27, b[0:6] |

**Figure 29. PLL Clock Source and Clock Distribution**

#### 8.13.4.3 PCM186x Software Programmable Device Clocking Configuration and Selection

##### 8.13.4.3.1 Configuration of Master Mode

If an external, high quality MCLK is available (either on the SCK pin or XTAL), then the PCM186x should be configured to run in Master Mode where possible, with the ADC and serial ports being driven from the MCLK/SCK source. The on-chip DSPs will continue to require clocks from the PLL, as they run from a much higher clock rate.

Clock MUXs and overall configuration can be done in register Page0, 0x20. For the best performance in master mode, where possible, the automatic clock configuration circuitry will configure the clocks as shown in [Table 9](#), depending on if the device is a PCM186x software programmable device. The tables below show data at 48kHz multiples, the ratios for multiples of 44.1kHz are identical, while the absolute MHz values will be multiples of 44.1kHz instead of 48kHz.

This automatic configuration can be bypassed using registers, starting from **CLKDET\_EN** (Page.0, 0x20).

**Table 9. PCM1863 Clock Divider and Source Control In The Presence Of External SCK**

| $f_s$   | SCK Ratio | SCK Frequency (MHz) | PLL Ratio | PLL Frequency (MHz) | PLL Configuration      | DSP1 Clock (MHz) | DSP1 Clock |    | DSP 2 Clock (MHz) | DSP2 Clock |    | ADC Clock (MHz) | ADC Clock |    |

#### 8.13.4.4 PCM186x BCK Input Slave PLL Mode

The PCM186x software programmable devices can generate an internal MCLK system clock using its PLL (referenced from an external input BCK) in slave mode. BCK must be  $64f_s$ . Supported sampling frequencies are listed in [Table 11](#). Whilst the PCM186x can support down to 8kHz, analog performance is not tested at this rate.

**Table 11. Auto PLL BCK Requirements**

| Sampling Frequency | BCK Ratio to LRCK | BCK Frequency |
|--------------------|-------------------|---------------|
| 8kHz               | 256               | 2.048         |
| 16kHz              | 64                | 1.024         |
|                    | 256               | 4.096         |
| 48kHz              | 32                | 1.536         |
|                    | 48                | 2.304         |
|                    | 64                | 3.072         |
|                    | 256               | 12.288        |
| 96kHz              | 32                | 3.072         |
|                    | 48                | 4.608         |
|                    | 64                | 6.144         |
|                    | 256               | 24.576        |
| 192kHz             | 32                | 6.144         |
|                    | 48                | 9.216         |
|                    | 64                | 12.288        |
|                    | 256               | 49.152        |

In software SPI/I<sup>2</sup>C mode, a PCM186x software programmable device can use its on-chip crystal oscillator, if a CMOS clock source is not available. Audio Clocks can be generated through the PLL from the non-audio standard CMOS/Crystal frequency (and then can be divided down as described above). This function is not available in hardware mode.

8kHz is only supported if an external MCK is provided. The Autodetect and PLL system support frequencies as low as 32kHz. Analog performance is not tested in this mode.

The clock tree can also be programmed manually, with the settings shown in [Table 12](#).

#### 8.13.4.5 PCM186x Software Programmable Devices ADC Non-Audio MCK PLL Mode

This mode is mainly used for systems driving TDM ports or systems where the MCK is not related to the audio sampling rate. Examples may be where the Audio ADC needs to share a clock source with the central processor. (This is commonly 12MHz, 24MHz or 27MHz.)

Under these conditions, the automatic configuration register **CLKDET\_EN (Page 0, 0x20)** should be set to 0, and the PLL manually configured, using registers (**Page 0, 0x28 - 0x2D**). See [PCM186x Software Programmable Devices Manual PLL Calculation](#).

#### 8.13.5 PCM186x Software Programmable Devices Manual PLL Calculation

The PCM186x has an on-chip PLL with fractional multiplication to generate the clock frequency required by the audio ADC, Modulator and Digital Signal Processing blocks. The programmability of the PLL allows operation from a wide variety of clocks that may be available in the system. The PLL input supports clocks varying from 1MHz to 50MHz and is register programmable to enable generation of required sampling rates with fine precision.

The PLL by default is enabled because the on-chip fixed function DSPs require high clock rates to complete all various decimation, mixing and level-detection functions. The PLL output clock PLLCK is given by [Equation 1: PLL Rate Calculation](#):

$$\text{PLLCK} = \frac{\text{PLLCKIN} \times R \times JD}{P} \quad \text{or} \quad \text{PLLCK} = \frac{\text{PLLCKIN} \times R \times K}{P} \quad (1)$$

R = 1, 2, 3, 4, .... 15, 16

J = 1, 2, 3, 4,...63, and D = 0000, 0001, 0002...9999

K = J.D

P = 1, 2, 3...15

R, J, D, and P are register programmable. J is the integer portion of K (the numbers to the left of the decimal point), while D is the fractional portion of K (the numbers to the right of the decimal point, assuming four digits of precision).

##### Examples:

If K = 8.5, then J = 8, D = 5000

If K = 7.12, then J = 7, D = 1200

If K = 14.03, then J = 14, D = 0300

If K = 6.0004, then J = 6, D = 0004

When the PLL is enabled and D = 0000, the following conditions must be satisfied:

1MHz = (PLLCKIN / P) = 20MHz

64MHz < (PLLCK IN x K x R / P) < 100MHz

1 = J = 63

When the PLL is enabled and D /= 0000, the following conditions must be satisfied:

6.667MHz = PLLCLK \_IN / P = 20MHz

64MHz < (PLLCK IN x K x R / P) < 100MHz

4 = J = 11

R = 1

When the PLL is enabled,

$$f_{\text{ref}} = (\text{PLLCLK\_IN} \times K \times R) / (N \times P)$$

N is selected so that  $f_{\text{ref}} \times N = \text{PLLCLK\_IN} \times K \times R / P$  is in the allowable range.

**Example:**

MCLK = 12MHz and  $f_{\text{ref}} = 44.1\text{kHz}$ , (N=2048)

Select P = 1, R = 1, K = 7.5264, which results in J = 7, D = 5264

**Example:**

MCLK = 12MHz and  $f_{\text{ref}} = 48.0\text{kHz}$ , (N=2048)

Select P = 1, R = 1, K = 8.192, which results in J = 8, D = 1920

The PLL can be programmed via Page 0, Registers 20 thru 24. The PLL can be turned on via Page 0, Register 4, D(0). The variable P can be programmed via Page 0, Register 20, D(3:0). The variable R can be programmed via Page 0, Register 24, D(3:0). The variable J can be programmed via Page 0, Register 21, D(5:0). The variable D is 14-bits and is programmed into two registers. The MSB portion can be programmed via Page 0, Register 22, D(5:0), and the LSB portion is programmed via Page 0, Register 23, D(7:0). The variable D is set when the LSB portion is programmed.

Values are programmed in the registers in [Table 14](#).

**Table 14. PLL Coefficient Registers**

| Register | FUNCTION                                  | BITS  |
|----------|---|---|
| PLL_EN   | PLL enable, Lock Status and PLL Reference | Page 0, Register 0x28                             |
| PLL_P    | PLL P                                     | Page 0, Register 0x29                             |
| PLL_J    | PLL J                                     | Page 0, Register 0x2B                             |
| PLL_Dx   | PLL D                                     | Page 0, Register 0x2C<br>(Least Significant Bits) |
|          |   | Page 0, Register 0x2D<br>(Most Significant Bits)  |
| PLL_R    | PLL R                                     | Page 0, Register 0x2A                             |

### 8.13.6 Clock Halt and Error

The PCM186x has a clock error detection block inside that continues to monitor the ratio of BCK to LRCK.

If a clock error is detected - such as an unexpected number of BCKs per LRCK, then the device will go into Standby mode, and an interrupt can be configured (software programmable devices) to inform the host.

Should all clocks be stopped going into the device, then the device will shift into Sleep state and begin Energysense Signal Detect Mode.

The status of the halt and error detector can be read from register: **CLK\_ERR\_STAT (Page.0, 0x75)**.

## 8.14 ADCs

### 8.14.1 Main Audio ADCs

The main ADCs in the PCM186x are 103dB, 40kHz bandwidth ADCs that are tightly coupled to dedicated PGAs and input multiplexers. Often in this document, references are made to ADC1L and ADC1R (or CH1\_L and CH1\_R), the main Left/Right ADCs present in both PCM1863 and PCM1865. References to ADC2L and ADC2R are the other pair of L/R ADCs present only in the PCM1865.

### 8.14.2 Secondary ADC - Energysense and Analog Control

The PCM186x has a secondary ADC which is used for signal level detection or DC level change detection.

## ADCs (continued)

**Figure 30. Secondary ADC Architecture**

The secondary ADC has two main purposes in the PCM186x family. The primary purpose is to act as a low power signal detection system, to aid with system wakeup from sleep. TI calls this functionality "Energysense". Other functionality includes the ability to use any spare analog inputs as "generic" ADC inputs, for connection to simple analog sources, such as voltages from control potentiometers. TI calls this functionality "Controlsense".

The secondary ADC is a one-bit delta-sigma type ADC. The sampling rate is directly connected to the main ADC audio sampling clocks during ACTIVE functionality. When the device is in SLEEP state, then the secondary ADC will switch clock source to an on-chip oscillator. (If there are no other clock sources.)

In sleep mode, the inputs are all treated as single ended inputs. Differential inputs are not supported in this mode, as the PGA would need to be powered up, which would consume more power.

To make the secondary ADC as flexible as possible in both Energysense and Controlsense modes, the following controls and coefficients are available in the register map. More details on each are in the relevant following sections.

- Coefficients for the Low Pass Filter
- Coefficients for the High Pass Filter
- Reference Voltage and Interrupt Voltage Delta for each input in Controlsense mode
- Signal Loss Conditions (Time and Threshold)
- Signal Resume Conditions (Time and Threshold)
- Interrupt behavior (Ping every X ms if host does not clear, for example.)
- Scan time for each single ended input.

### 8.14.2.1 Secondary ADC Analog Input Range

To match the dynamic range of the secondary ADC to an incoming line level signal, an overall attenuation is applied to the incoming signal. This attenuation is also present in Controlsense mode. The impact of this is that the secondary ADC in Controlsense mode can only detect control signals up to 1.65 volts. Control signals should be appropriately attenuated external to the PCM186x. This could be easily done by putting a resistor of the same value as a control potentiometer in series.

## ADCs (continued)

### 8.14.2.2 Energysense Description

Energysense functionality has been added to the PCM186x to aid with auto-sleep and auto-wakeup for audio systems that are expected to be sold within the European Union. The latest EcoDesign legislation in Europe has demanded that products consume less than 500 mW in standby. Most off-the-shelf external power adaptors can consume 300mW when idling, leaving the system with only 200 mW available. In many systems that require that almost everything be powered down in sleep mode, to be powered back up when signal enters the system again.

Energysense is split into two functions: Signal Loss Flag and Signal Resume Flag. Both are available on the PCM186x software controlled devices. The PCM1861 only supports signal resume. Usage is shown below. By default, the Signal Resume Threshold is set at -57dBFS.

**Table 15. Energysense States**

| MODE                          | PURPOSE  | CONDITIONS  | POSITIVE OUTCOME   | WORST CASE  |
|-------------------------------|--|---|--|---|
| SLEEP<br>(Signal Detect Mode) | Detect Input Signal and Wake up from SLEEP   | BCK and LRCK stopped (not locked) or Register Set.                  | Host Wakes and services interrupt (reads register)                               | Host Doesn't respond or start clocks.                           |
|                               |  | Trigger Interrupt when input crosses above (threshold)              | Host Starts BCK/LRCK. (Moving system to ACTIVE mode) or writes to register.      | PCM186x keeps triggering interrupts until host responds.        |
|                               |  | Trigger for 1ms every X seconds until clocks start (x=1 by default) |  |   |
| ACTIVE<br>(Signal Loss Mode)  | Detect content below (threshold) over time   | BCK and LRCK are currently running                                  | System can choose to go to sleep or not. If not, reset interrupt                 | If system does not sleep, remain in Mode 2, and prompt every Y. |
|                               | Assist system to sleep after audio inactivity (for example, Source is off, but speaker still on) | If no content above -(threshold) dB for Y minutes, drive interrupt. | If System decides to sleep, stop BCK/LRCK. This will move PCM186x to SLEEP mode. | MCU will need to mask that interrupt.                           |

### 8.14.2.3 Energysense Signal Loss Flag

The main ADC constantly monitors the input signal level while in ACTIVE mode. Should the input level remain below a register defined threshold (for example -60dB) for a register defined amount of time (for example 1 minute), an interrupt will be generated.

Should the system MCU decide to move to SLEEP mode, the PCM186x can be moved to SLEEP by stopping BCK/LRCK or using a register. See [Table 15](#) for detail. If BCK and LRCK are stopped by the Host after the interrupt, the device goes to the sleep state as shown in [Figure 31](#). Otherwise, the device repeats the interrupt every Y minutes as shown in [Figure 32](#). The interrupt can be cleared by reading the status register.

**Figure 31. Energysense Signal Loss**

In a typical application, the host MCU will note and reset this register multiple times until a system sleep number is hit. For example, a 5-minute signal loss could be implemented by using the default 1-minute timeout on the PCM186x, and counting 5 interrupts. An example can be seen in the diagram below.

**Figure 32. Interrupt Behavior for Signal Loss.**

Alternatively, the **SIGDET\_LOSS\_TIME** (Page.0, 0x34) register in the device can be changed from 1 minute (Default) to 5 minutes.

The duration of the interrupt can also be modified using **INT\_PLS** (Page.0 0x62) to be pulses or to be a sticky flag until cleared.

#### 8.14.2.4 Energysense Signal Detect Circuitry

In SLEEP mode (BCK and LRCK stop, or by register), the PCM186x monitors the signal level or DC level change using the secondary ADC. All 8 channels are converted one after the other in a circular manner. The scan time can be specified with a register **SIGDET\_SCAN\_TIME**. All 8 channels will be measured, even if some have their interrupt outputs muted. Accuracy and frequency response are a function of scan time. A long scan time allows detection of lower frequency content.

**Figure 33. Energysense Signal Wakeup Logic**

There is a balance between lowest frequency detectable, and time on that particular channel. There are three options in register **SIGDET\_INT\_INTVL** (Page.0 0x36):

- 50 Hz detect (160ms per channel)
- 100 Hz detect (80ms per channel)
- 200 Hz detect (40ms per channel)

##### 8.14.2.4.1 Energysense Threshold Levels for both Signal Loss and Signal Detect

There are two threshold levels used for Energysense. One is the loss of signal level, another one is the resume of signal level.

**Figure 34. Dual Thresholds for Energysense**

As both thresholds are DSP based, their coefficients are stored in virtual coefficient space that is programmed through the device register map.

For example, to change the resume threshold value to -30dB (0x040C37):

Write 0x00 0x01 ; # change to register page 1

Write 0x02 0x2D ; # write the memory address of resume threshold

Write 0x04 0x04 ; # bit[23:15]

Write 0x05 0x0C ; # bit[15:8]

Write 0x06 0x37 ; # bit[7:0]

Write 0x01 0x01 ; # execute write operation

#### 8.14.2.5 Frequency Response of the Secondary ADC

The natural response of the secondary ADC is not flat by frequency. However, the frequency response can be flattened, so that all frequencies are equally sensitive to the energystar detector by modifying the LPF/HPF biquads in the DSP.

An example of the code required is shown in [Table 16](#).

#### 8.14.3 Programming Various Coefficients for Energysense

Programming the DSP coefficients for the Energysense secondary ADC is done through the indirect virtual programming registers in Page1. The Low Pass Filter (LPF) and High Pass filter (HPF) coefficients can be written to flatten out the frequency response, as well as the Energysense Loss and Resume thresholds. Visually, one can imagine the DSP flow as shown in [Figure 35](#).

**Figure 35. Energysense process flow**

To flatten out the response of the secondary ADC, so that all frequencies are detected evenly, the following biquads should be written to the virtual DSP memory, using the techniques discussed in [Programming DSP Coefficients](#).

**Table 16. Secondary ADC Biquad Coefficients at 48kHz Sampling**

| Coefficient | Virtual RAM Address |
|-------------|---------------------|
| LPF_B0:     | 0x20                |
| LPF_B1:     | 0x21                |
| LPF_B2:     | 0x22                |
| LPF_A1:     | 0x23                |
| LPF_A2:     | 0x24                |

**Table 16. Secondary ADC Biquad Coefficients at 48kHz Sampling (continued)**

| Coefficient | Virtual RAM Address |
|-------------|---------------------|
| HPF_B0:     | 0x25                |
| HPF_B1:     | 0x26                |
| HPF_B2:     | 0x27                |
| HPF_A1:     | 0x28                |
| HPF_A2:     | 0x29                |

#### 8.14.4 Secondary ADC DC Level Change Detection

This function is used for external analog controls, such as potentiometers to set volume, tone control, or a sensor.

There are two parameters for the DC level change detection. Reference level (REF\_LEVEL) and Difference level (DIFF\_LEVEL). Each input pin (input 1 through 8) has a different reference and difference level.

Users set a reference point, and a difference point. If the voltage at the control point crosses the difference point then an interrupt is driven from the device. This is useful for filtering out noise, as well as reducing the load on the host processor for controls that tend to be "set and forget" (such as volume).

The data from the secondary ADC can also be streamed out of the device in TDM form and directly from the I<sup>2</sup>C register map. **AUXADC\_DATA\_CTRL (Page.0 0x58)** is used to configure and check the status of the DC detector.

**Figure 36. DC Detection function**

### 8.15 Audio Processing

Both DSP1 and DSP2 are fixed function processors that are not custom-programmable. They are used in this device to perform multiple filtering and mixing functions. Programming the DSP coefficients is done indirectly using registers on Page1. The data and target DSP memory address are stored in registers, and once the DSPs are ready for the data (that is done by request) the data is then latched into the DSP memory.

This indirect method of programming the DSP allows multiple registers to be written, without consuming valuable register map space. More details can be found in the [Programming DSP Coefficients](#) section.

#### 8.15.1 DSP1 Processing Features

##### 8.15.1.1 Digital Decimation Filters

The decimation filter used to convert the high-data-rate modulator to I<sup>2</sup>S rates is selectable between a Classic FIR response and a low-latency IIR response. A high pass filter is also available to remove any DC bias that may be present in the signal.

Details can be found in the **DSP\_CTRL** register ([Page.0, 0x71](#)).

## Audio Processing (continued)

### 8.15.1.2 Digital PGA Gain

As discussed in the [Programmable Gain Amplifier](#) section, the digital PGA gain can be controlled by the auto gain mapping function, that will use the analog gain settings in register **PGA\_VAL\_CH1\_L** ([Page.0 0x01](#)) and related registers to achieve the target gain with a combination of digital and analog gain. However, digital gain can be also controlled directly by disabling the auto gain mapping function using register **PGA\_CONTROL\_MAPPING** ([Page.0 0x19](#)).

### 8.15.2 DSP2 Processing Features

#### 8.15.2.1 Digital Mixing Function

This function allows post ADC mixing, as well as ADC + incoming I<sup>2</sup>S mix. Volume control functionality can be performed prior to outputting the signal to an I<sup>2</sup>S DAC or Amplifier.

Gain range is from -100dB to + 18dB (20 bits negative up +18dB, 4.20 format).

As the DSP coefficients are directly written, no soft ramping is available. Use of I<sup>2</sup>S receive sacrifices 2 digital mic channels due to pin limitations.

Coefficients are written indirectly to virtual memory addresses using the registers on Page 1. Details of the registers are shown in the [Register Map](#) section.

A diagram of the digital mixing functionality is shown in [Figure 37](#).

**Figure 37. Digital Mixer Functionality**

## 8.16 Fade-In and Fade-Out Functions

The PCM186x has Fade-In and Fade-Out functions on DOUT to avoid pop noise. This function is engaged on device power up/down and mute/unmute. The level changes from 0dB to mute or mute to 0dB are performed using pseudo S-shaped characteristics calculation with zero cross detection. Because of the zero cross detection, the time needed for the Fade-In and Fade-Out depends upon the analog input frequency ( $f_{in}$ ). Fade takes  $48/f_{in}$  until processing is completed. If there is no zero cross during  $8192/f_s$ , DOUT is faded in or out by force during  $48/f_s$  (TIME OUT). [Figure 38](#) illustrates the Fade-In and Fade-Out operation processing.

**Figure 38. Fade-In and Fade-Out Operations**

## 8.17 Mappable GPIO Pins

All the GPIO pins on the PCM186x software programmable devices can be configured for various functions. They can each have their polarity inverted to make control of following circuits easier. See the control registers for each GPIO for a better explanation of mapping. (such as [GPIO1\\_FUNC at Page.0 0x10](#))

The type of function can also be controlled, including such behavior as regular inputs, inputs with toggle detection, or sticky bits. The device can also be configured as an open drain output, so that multiple interrupt outputs from different devices in the system can be connected together.

## 8.18 Current Status Registers

[Page.0, Registers 0x72 through 0x75 and 0x78](#) can be used to read the device status at any time. Sample Rate, Power Rail status, Clock Error and Clock Ratios can all be read from these registers.

## 8.19 Control

### 8.19.1 Hardware Control Configuration

PCM186x devices require the following functions to be configured on startup. Hardware Programmable devices require a subset of these configurations.

1. Control Interface type and address for PCM186x software programmable devices
2. The Clock Mode and Rate (Automatic in Slave Mode, or divider ratio in Master Mode) (For more details see the [Clocks](#) section.)
3. The Interface Audio Data Format
4. Digital Filter Selection (FIR or IIR) (requires a power cycle to change)
5. Analog Input Channels and PGA Gain

### 8.19.2 Software Controlled Device Configuration

PCM186x software programmable devices are configured and controlled by using either I<sup>2</sup>C or SPI using MD0.

**Table 17. MD0 - Control Protocol Select**

| MD0               | Control Protocol      |
|-------------------|-----------------------|
| Low (or floating) | I <sup>2</sup> C Mode |
| High              | SPI Mode              |

**Table 18. MD1 - I<sup>2</sup>C Address or SPI Chip Select**

| Mode             | MD1 Usage            | Static MD1 Value | Configuration                  |
|------------------|----------------------|------------------|--------------------------------|
| I <sup>2</sup> C | Address pin          | Low              | I <sup>2</sup> C Address: 0x94 |
| I <sup>2</sup> C | Address pin          | High             | I <sup>2</sup> C Address: 0x96 |
| SPI              | MS (SPI Chip Select) | N/A              | N/A                            |

### 8.19.3 SPI Interface

The SPI interface is a 4-wire synchronous serial port which operates asynchronously to the serial audio interface and the system clock (SCK). The serial control interface is used to program and read the on-chip mode registers.

The control interface includes MISO, MOSI, MC, and MS. MISO (Master In Slave Out) is the serial data output, used to read back the values of the mode registers; MOSI (Master Out Slave In) is the serial data input, used to program the mode registers.

MC is the serial bit clock, used to shift data in and out of the control port on the MC falling edge. MS is the active-low mode control enable, used to enable the internal mode register access. If data from the device is not required, the MISO pin can be assigned to GPIO1 by register control.

#### 8.19.3.1 Register Read/Write Operation

All read/write operations for the serial control port use 16-bit data words. [Figure 39](#) shows the control data word format. The most significant bit is the read/write (R/W) bit. For write operations, the bit must be set to 0. For read operations, the bit must be set to 1. There are seven bits, labeled IDX[6:0], that hold the register index (or address) for the read and write operations. The least significant eight bits, D[7:0], contain the data to be written to, or the data that was read from, the register specified by IDX[6:0].

[Figure 40](#) and [Figure 41](#) show the functional timing diagram for writing or reading through the serial control port. MS should be held at logic 1 state until a register needs to be written or read. To start the register write or read cycle, MS should be set to logic 0. Sixteen clocks are then provided on MC, corresponding to the 16 bits of the control data word on MOSI and readback data on MISO. After the eighth clock cycle has completed, the data from the indexed-mode control register appears on MISO during the read operation. After the sixteenth clock cycle has completed, the data is latched into the indexed-mode control register during the write operation. To write or read subsequent data, MS should be set to logic 1 once.

NOTE: Bit 8 is used for selection of "Write" or "Read". Setting = 0 indicates a "Write", while = 1 indicates a "Read". Bits 15–9 are used for register address. Bits 7–0 are used for register data.

**Figure 39. Control Data Word Format for MDI**

**Figure 40. Serial Control Format for Write**

Figure 41. Serial Control Format for Read

### 8.19.4 I<sup>2</sup>C Interface

The PCM186x software programmable devices support the I<sup>2</sup>C serial bus and the data transmission protocol for standard and fast mode as a slave device. This protocol is explained in I<sup>2</sup>C specification 2.0.

In I<sup>2</sup>C mode, the control pins are changed as follows:

**Table 19. I<sup>2</sup>C Pins and Functions**

| PIN NAME | PIN NUMBER | PROPERTY       | DESCRIPTION                |
|----------|------------|----------------|----------------------------|
| SDA      | 15         | Input / Output | I <sup>2</sup> C Data      |
| SCL      | 16         | Input          | I <sup>2</sup> C Clock     |
| AD       | 14         | Input          | I <sup>2</sup> C Address 1 |

#### 8.19.4.1 Slave Address

**Table 20. I<sup>2</sup>C Slave Address**

| MSB | 0 | 0 | 1 | 0 | 1 | AD | LSB |
|-----|---|---|---|---|---|----|-----|
| 1   |   |   |   |   |   |    | R/W |

The PCM186x software programmable devices have a 7-bit slave address. The first six bits (MSBs) of the slave address are factory preset to 1001 01. The next bit of the address byte is the device select bit, which can be user-defined by the AD pin. A maximum of two PCM186x devices can be connected on the same bus at one time. Each device responds when it receives its own slave address.

#### 8.19.4.2 Packet Protocol

A master device must control packet protocol, which consists of start condition, slave address, read/write bit, data if write or acknowledge if read, and stop condition. The PCM186x software programmable devices support only slave receivers and slave transmitters.

#### write operation

| Transmitter | M  | M             | M   | S   | M    | S   | M    | S   | S     | M   |    |
|-------------|----|---------------|-----|-----|------|-----|------|-----|-------|-----|----|
| Data Type   | St | slave address | R/W | ACK | DATA | ACK | DATA | ACK | ----- | ACK | Sp |

#### read operation

| Transmitter | M  | M             | M   | S   | M    | S   | M    | S   | S     | M   |    |
|-------------|----|---------------|-----|-----|------|-----|------|-----|-------|-----|----|
| Data Type   | St | slave address | R/W | ACK | DATA | ACK | DATA | ACK | ----- | ACK | Sp |

M: Master Device

S: Slave Device

St: Start Condition

Sp: Stop Condition

**Figure 42. Basic I<sup>2</sup>C Framework**

### 8.20 Interrupt Controller

The hardware controlled PCM1861 has the Energysense signal detect as the default output on the INT pin. There are no other interrupt sources. The INT pin on the PCM1861 is also used to put the device into power-down mode.

## Interrupt Controller (continued)

The Software controlled devices have multiple signals that can be mapped to the interrupt outputs. These include:

- Energysense (DEFAULT)
- Secondary ADC Controlsense Interrupt
- Clock Error
- DIN Toggle

The Interrupt controller has the following features

- The Interrupt sources can be filtered by the enable register (INT\_EN).
- The Interrupt flags can be monitored by reading the status register (INT\_STAT).
- The interrupt flags can be cleared by writing the status register.
- The polarity of the interrupt signal can be changed between active high, active low and Open Collector (High Impedance is pulled to GND) (INT\_PLS).
- The pulse width of the interrupt signal can be changed between 1ms, 2ms, 3ms and Infinity (until the flag is cleared).

**Figure 43. Interrupt Logic**

Using a combination of these features, as well as the interrupt sources, allows the PCM186x to alert a host microcontroller of an event, using whichever polarity signal required (Pull High, Pull Low, Hiz-Open Collector). The Host controller can then communicate with the device to poll the interrupt flag register to find out "what happened". Additional registers can then be read for more details. (For instance, which input triggered an Energysense event.)

### 8.20.1 Clock Error Detect

When a clock error occurs, the PCM186x starts the following sequence:

1. Mute audio output immediately (without volume ramp down)
2. Generate an interrupt if the clock error interrupt is enabled
3. Wait until proper clock is supplied (Known as "Clock Waiting State")
4. Restart the clock detection. The PLL and all clock dividers are reconfigured with the result of the detection.
5. Start Fade-IN

## Interrupt Controller (continued)

The clock error status can be read in register **CLK\_ERR\_STAT (Page.0 0x20)**. The clock detection logic is shown below:

**Table 21. Summary of Clock Detection Logic**

| SCK    | BCK    | LRCK   | Result      | Action                    |
|--------|--------|--------|-------------|---------------------------|
| ACTIVE | ACTIVE | ACTIVE | No Error    | Normal Operation          |
| ACTIVE | ACTIVE | HALT   | Clock Error | Enter Clock Waiting State |
| ACTIVE | HALT   | ACTIVE | Clock Error | Enter Clock Waiting State |
| ACTIVE | HALT   | HALT   | Clock Error | Enter SLEEP               |
| HALT   | ACTIVE | ACTIVE | No Error    | Enter BCK PLL Mode        |
| HALT   | ACTIVE | HALT   | Clock Error | Enter Clock Waiting State |
| HALT   | HALT   | ACTIVE | Clock Error | Enter Clock Waiting State |
| HALT   | HALT   | HALT   | Clock Error | Enter SLEEP               |

In addition, the device uses an on-chip oscillator to detect errors in the rate of present clocks. That logic is shown below:

**Table 22. Summary of Clock Error Logic**

| SCK/LRCK Ratio                  | BCK/LRCK Ratio         | LRCK   | Error Detect | Action  |
|---------------------------------|------------------------|--|--------------|---|
| -                               | -                      | < 8kHz or > 192kHz                                   | $f_S$ error  | Enter Clock Waiting State                                       |
| Not 128 / 256 / 384 / 512 / 768 | -                      | 8 / 16 / 32 / 44.1 / 48 kHz                          | SCK error    | Enter the clock waiting state, tie I <sup>2</sup> S output to 0 |
| Not 128 / 256 / 384 / 512       | -                      | 88.2 / 96kHz   | SCK error    | Enter the clock waiting state, tie I <sup>2</sup> S output to 0 |
| Not 128 / 256                   | -                      | 176.4 / 192kHz                                       | SCK error    | Enter the clock waiting state, tie I <sup>2</sup> S output to 0 |
|                                 | Not 256 / 64 / 48 / 32 | 8 / 16 / 32 / 44.1 / 48 / 88.2 / 96 / 174.6 / 196kHz | BCK error    | Enter the clock waiting state, tie I <sup>2</sup> S output to 0 |
|                                 |                        | >192kHz  | $f_S$ error  | Enter the clock waiting state, tie I <sup>2</sup> S output to 0 |

In an application with a non-audio standard SCK coming into the product, the clock error detection on the SCK pin can be ignored by disabling the Auto Clock Detector (**CLKDET\_EN Page.0 0x20**).

## 8.21 Audio Format Selection and Timing Details

### 8.21.1 Audio Format Selection

Format selection for the PCM1861 is controlled using a hardware pin configuration. There is a choice of Left Justified Data (known as "LJ") or I<sup>2</sup>S.

However, on the PCM186x software programmable devices, format selection is done with the registers in **I2S\_FMT (Page.0 0x0B)**, which offers additional support for Right Justified "RJ" and Time Division Multiplexed data "TDM" for multiple channels.

The PCM186x software programmable devices also offer an additional DOUT pin that can be driven through the GPIO pins. For example, see register details at **GPIO1\_FUNC (Page.0 0x10)**.

### 8.21.2 Serial Audio Interface Timing details

FORMAT 0: FMT = "Low" 24-bit, MSB-First, I<sup>2</sup>S

FORMAT 1: FMT = "High" 24-bit, MSB-First, Left-Justified

**Figure 44. Audio Data Format**  
(LRCK and BCK work as inputs in slave mode and as outputs in master mode)

### 8.21.3 Digital Audio Output 2 Configuration

The PCM186x software programmable devices offer an additional DOUT through the use of a GPIO that has its rate synchronized with the primary DOUT. DOUT2 is configured using the digital mixer, shown in [Digital Mixing Function](#).

### 8.21.4 Decimation Filter Select

The PCM186x offers a choice of two different digital filters, a Classic FIR response and a low latency IIR.

### 8.21.5 Serial Audio Data Interface

The PCM186x devices interface to the audio system through LRCK, BCK and DOUT.

The PCM1861 is configured using pin MD4 to select between Left Justified Data and I<sup>2</sup>S.

The PCM186x software programmable devices are configured using register **I2S\_FMT (Page.0 0x0B)**. Register **I2S\_TX\_OFFSET (Page.0 0x0D)** should be used when dealing with TDM systems to offset the data transmit.

In addition, the offset required for receiving 24-bit data can be programmed using **RX\_TDM\_OFFSET (P0, R0x0E)**.

## Audio Format Selection and Timing Details (continued)

### 8.21.5.1 Interface Timing

Figure 45 and Figure 46 illustrate the interface timing in slave mode, and Figure 47 shows master mode.

(1) Timing measurement reference level is 1.4V for input and 0.5V/DD for output. Rise and fall times are measured from 10% to 90% of the IN/OUT signals' swing. Load capacitance of DOUT is 20pF.  $t_{SCKI}$  means SCKI period.

**Figure 45. Audio Data Interface Timing (Slave Mode: LRCK and BCK work as inputs)**

| PARAMETER <sup>(1)</sup> |   | MIN | TYP         | MAX  | UNIT    |
|--------------------------|---|-----|-------------|------|---------|
| $t_{BCKP}$               | BCK Period                                | 150 | $1/(64f_S)$ | 2000 | ns      |
| $t_{BCKH}$               | BCK Pulse Width HIGH                      | 65  |             | 1000 | ns      |
| $t_{BCKL}$               | BCK Pulse Width LOW                       | 65  |             | 1000 | ns      |
| $t_{CKLR}$               | Delay Time BCK Falling Edge to LRCK Valid | -10 |             | 20   | ns      |
| $t_{LRCP}$               | LRCK Period                               | 10  | $1/f_S$     | 125  | $\mu$ s |
| $t_{CKDO}$               | Delay time BCK Falling Edge to DOUT Valid | -10 |             | 20   | ns      |
| $t_{LRDO}$               | Delay time LRCK Edge to DOUT Valid        | -10 |             | 20   | ns      |
| $t_R$                    | Rise Time of All Signals                  |     |             | 20   | ns      |
| $t_F$                    | Fall Time of All Signals                  |     |             | 20   | ns      |

- (1) Timing measurement reference level is 0.5  $V_{DD}$ . Rise and fall times are measured from 10% to 90% of the IN/OUT signals' swing. Load capacitance of all signals are 20pF.

**Figure 46. Audio Data Interface Timing (Master Mode: LRCK and BCK work as outputs)**

- (1) Timing measurement reference level is 1.4V for input and 0.5  $V_{DD}$  for output. Load capacitance of BCK is 20pF. This timing is applied when SCKI frequency is less than 25MHz.

**Figure 47. Audio Data Interface Timing (Master Mode: BCK works as outputs)**

## 8.22 Device Functional Modes

### 8.22.1 Power Mode Descriptions

The PCM186x family have multiple power states. They are "Active", "Sleep", "Idle" and "Standby".

**Active Mode** describes the active mode where the device is targeting full performance and functionality.

**Sleep Mode** describes a mode where the main ADCs are not in use, but the device continues to do Energysense input level detection.

**Idle Mode** describes a mode where the digital output is muted and the analog side (such as PGAs) are still powered up.

**Standby / Shutdown** drops the power into an ultra-low power mode where only the control port is available.

**Table 23. Power Modes**

| Analog Functions           | Active or Idle (Mute) | Sleep (Energysense) | Standby / Shutdown        |
|----------------------------|-----------------------|---------------------|---------------------------|
| Programmable Gain Amps     | ON                    | OFF                 | OFF                       |
| ADC                        | ON                    | OFF                 | OFF                       |
| ADC Reference              | ON                    | OFF                 | OFF                       |
| CMBF                       | ON                    | ON                  | ON                        |
| Reference                  | ON                    | ON                  | ON                        |
| Mic Bias                   | ON                    | ON                  | OFF                       |
| Secondary ADC PGA          | ON                    | ON                  | OFF                       |
| Secondary PGA              | ON                    | ON                  | OFF                       |
| <b>Accessory Functions</b> |                       |                     |                           |
| LDO                        | ON                    | ON                  | ON                        |
| Oscillator                 | ON                    | ON                  | ON                        |
| Clock Halt Detection       | ON                    | ON                  | ON                        |
| PLL                        | ON                    | ON                  | OFF                       |
| Digital Cores              | ON                    | 20% ON              | 5% ON (Control Port Only) |

### 8.22.1.1 PCM1861 Hardware Device Power Down Functions

#### Enter or Exit Chip Standby mode for PCM1861

##### Enter Standby mode (from active mode):

The external host should drive the INT pin (GPIO3) HIGH (whilst there is no interrupt pending) to place the device in Idle mode.

The INT pin is configured as an Energysense interrupt output on the hardware-controlled device; therefore, the external host microcontroller should use it as multi-function pin. (MCU pin configured as INPUT when no requirement exists to move to standby, MCU pin as OUTPUT driving HIGH when a need exists to place the device in an idle state.)

---

##### NOTE

While the device is driving its interrupt high, any external voltage on the INT pin will be ignored by the device, until the interrupt event (and pulse) is finished.

---

##### Exit From Standby Mode:

The external MCU host releases the INT pin (GPIO3). This typically involves reconfiguring the external MCU GPIO into an INPUT or HI-Z.

#### Enter or Exit Sleep / Energysense mode for PCM1861

Enter sleep mode: Halt BCK and LRCK

Exit sleep mode: Resume BCK and LRCK

### 8.22.1.2 PCM186x Software Device Power Down Functions

#### Enter or Exit Stand-by mode for Software Controlled Device

Enter standby mode: Send power down command by writing register **PWRDN\_CTRL (Page.0 0x70)**

Exit standby mode: Send power up command by writing register **PWRDN\_CTRL (Page.0 0x70)**

#### Enter or Exit Sleep mode for Software Device:

(1) Send sleep command by writing register **PWRDN\_CTRL (Page.0 0x70)** or

(2) Halt BCK and LRCK when I<sup>2</sup>S is configured as I<sup>2</sup>S Slave mode

#### Exit Sleep mode:

(1) Send resume from (exit) sleep command by writing register PWRDN\_CTRL or

(2) Resume BCK and LRCK when I<sup>2</sup>S is configured as I<sup>2</sup>S master mode

### 8.22.1.3 Bypassing The Internal LDO To Reduce Power Consumption

The PCM186x has an integrated LDO allowing single 3.3V supply operation. However, developers desiring to minimize power consumption can bypass the on-chip LDO and provide 1.8V to DVDD under the following conditions:

- TDM Mode is not possible (the I/O or other function requires 3.3V)
- IOVDD MUST be 1.8V along with LDO, if an external 1.8V supply is used to bypass the internal LDO.

## 9 Applications and Implementation

### 9.1 Application Information

The PCM186x family is extremely flexible, and this flexibility gives rise to a number of design questions that define the design requirements for a given application. In this section, the design choices are described, followed by a typical system implementation.

- [Device Control Method](#)
  - Hardware Control
  - Software Control
    - SPI
    - I<sup>2</sup>C
- [Power Supply Options](#)
  - Single supply
  - Separate analog and digital supplies
  - Separate IO supply
- [Master Clock Source](#)
  - External CMOS-level clock
  - External crystal with integrated oscillator
- [Analog Input Configuration](#)
  - Single-ended
  - Differential

#### 9.1.1 Device Control Method

##### 9.1.1.1 Hardware Control

The PCM18611 is controlled with pullup or pulldown voltages on pins MD0 through MD6. The INT pin is ideally designed to be used with a microcontroller that can treat the pin as both an input (when used as an interrupt) and as an output to pull the pin high, and force power-down. See [Pin Assignments, PCM1861](#) for specific configuration details.

**Figure 48. PCM1861 Hardware Control Interface**

## Application Information (continued)

### 9.1.1.2 Software Control

#### 9.1.1.2.1 SPI Control

SPI control is selected by the MD0 pin; in this case, MDO connects to 3.3V, so that the device acts as an SPI slave.

**Figure 49. SPI Control Interface Including Interrupt Signals**

#### 9.1.1.2.2 I<sup>2</sup>C Control

I<sup>2</sup>C control is selected by the MD0 pin; in this example, MDO is pulled down to ground, so that the device acts as an I<sup>2</sup>C slave. One address line is supported to select between two devices on the same bus.

**Figure 50. I<sup>2</sup>C Control Interface Including Interrupt Signals**

### 9.1.2 Power Supply Options

#### 9.1.2.1 3.3V AVDD, DVDD and IOVDD

3.3V AVDD, DVDD and IOVDD is the most typical power supply configuration.

## Application Information (continued)

**Figure 51. Single 3.3V Supply**

### 9.1.2.2 3.3V AVDD, DVDD and 1.8V IOVDD

For details regarding lower power applications, please see [3.3V AVDD, DVDD with a 1.8V IOVDD for lower power applications](#).

### 9.1.3 Master Clock Source

The PCM186x family offers 3 different clock sources. For the highest performance, run the ADC in master mode from a stable, well-known SCK source, such as a CMOS SCK, or a external crystal (XTAL). The PCM186x is easy to hook up to a crystal, simply connect to XI and XO, and add capacitors to ground, as suggested in the XTAL manufacturers datasheet (typically 15pF).

External CMOS clock sources can be brought directly into the SCKI pin (for 3.3V sources) or into the XI pin (1.8V sources).

If you have a clock source that is unrelated to the audio rate, then the PLL will need to be enabled. For instance, a 12MHz USB crystal will require custom PLL settings to generate the 48kHz rate clocks and the 44.1kHz rate clocks required by many audio systems. An example with a 12MHz clock is shown in [PCM186x Software Programmable Devices Manual PLL Calculation](#).

### 9.1.4 Analog Input Configuration

#### 9.1.4.1 Analog Front End Circuit For Single-Ended Line-In Applications

Most systems can simply use an input filter similar to [Figure 52](#). However, for systems with significant out of band noise, a simple filter such as that shown in [Figure 53](#) can be used for pre-ADC anti-aliasing filtering. The recommended resistor value is 100Ω. Film-type capacitors of 0.01μF should be located as close as possible to the VINLx and VINRx pins and should be terminated to GND as close as possible to the AGND pin to maximize the dynamic performance of the ADC.

**Figure 52. Analog Input Circuit for Single Ended Input Applications**

**Figure 53. Analog Input Circuit with Additional Anti Aliasing Filter for Single Ended Applications**

## Application Information (continued)

### 9.1.4.2 Analog Front End Circuit Differential Line In Applications

As in single-ended applications, most systems can simply use an input filter similar to Figure 54. However, for systems with significant out of band noise, a simple filter such as that shown in Figure 55 can be used for pre-ADC anti-aliasing filtering. The recommended R value is  $47\Omega$ . Film-type capacitors of  $0.01\mu F$  should be located as close as possible to the VINLx and VINRx pins and should be terminated to GND as close as possible to the AGND pin to maximize the dynamic performance of ADC. To maintain common mode rejection, the series resistors should be matched as closely as possible.

**Figure 54.** Analog Input Circuit for Differential Input Applications

**Figure 55.** Differential Input Circuit with Additional Anti Aliasing Filter for Single Ended Applications

## 9.2 Typical Applications

### 9.2.1 PCM1861 with 3.3V AVDD, DVDD and IOVDD, Master Mode with XTAL

**Figure 56.** Simplified Schematic, PCM1861 Hardware-Controlled Subsystem

## Typical Applications (continued)

### 9.2.1.1 Design Requirements

- Device control method: Hardware control by digital GPIO pins of a microcontroller
- XTAL used for master mode
- Single-ended analog inputs

### 9.2.1.2 Detailed Design Procedure

- Device control method: Hardware control by digital GPIO pins of a microcontroller
- Select XTAL capacitors by reading the XTAL datasheet
- Single-ended analog inputs
  - MD2, MD5, MD6 configuration - (See [Pin Assignments, PCM1861](#))
- Audio slave mode
  - MD0, MD1 grounded (See [Figure 56, Pin Assignments, PCM1861](#))
- The power rails in this application allow the usage of X7R Ceramic capacitors. A maximum voltage rating of 6.3V should be enough for the power supply capacitors.
- Configure the microcontroller INT pin to be an input for interrupts, or change the function to output to pull high to power down the PCM1861.

### 9.2.1.3 Application Curves

Figure 57. Frequency Response with –1dB Input at 1kHz

## Typical Applications (continued)

### 9.2.2 PCM1863 with 3.3V AVDD, DVDD , 1.8V IOVDD, BCK Input Slave PLL

**Figure 58. Simplified Schematic, PCM1863 I<sup>2</sup>C Controlled Subsystem**

#### 9.2.2.1 Design Requirements

- Device control method: Software control by I<sup>2</sup>C
- Clock slave to a 1.8V device that only supplies BCK and LRCK (such as a *Bluetooth* Module)
- Single-ended analog inputs

#### 9.2.2.2 Detailed Design Procedure

- Device control method: Configure for I<sup>2</sup>C by Pulling MD0 to GND, and setting I<sup>2</sup>C address by setting the AD pin High or Low
- Ensure that BCK is configured in clock master device to be  $64 \times f_S$  for automatic PLL setting to function.
- Single-ended analog inputs
  - MD2, MD5, MD6 configuration - see [Table 2](#)
- Audio slave mode
  - Configure appropriate clock registers
  - Page.0 0x20 - Set MST\_MODE=1 (I<sup>2</sup>S Slave)
- The power rails in this application allow the usage of X7R Ceramic capacitors. A maximum voltage rating of 6.3V should be enough for the power supply capacitors.

## Typical Applications (continued)

### 9.2.2.3 Application Curves

Figure 59. Frequency Response with –60dB Input at 1kHz

## 10 Power Supply Recommendations

### 10.1 Power Supply Distribution and Requirements

The PCM186x has the following pins used for powering the device.

**Figure 60. PCM186x Power Distribution Tree**

The PCM186x uses a combination of 3.3V functional blocks and 1.8V functional blocks to achieve high analog performance, combined with high levels of digital integration. As such, the device has 3 internal power rails. AVDD provides the analog circuits with a clean 3.3V rail. DVDD is used for 3.3V digital clock circuits. Externally, AVDD and DVDD can be connected together without significant impact to performance.

The PCM186x integrates an on-chip LDO to convert an external 3.3V to 1.8V required by the digital core. The LDO input is derived from the IOVDD.

**Table 24. Power Supply Pin Descriptions**

| NAME  | USAGE / DESCRIPTION  |
|-------|--|
| AVDD  | Analog Voltage Supply - should be 3.3V. Powers the ADC, PGA, Reference, and Secondary ADC  |
| DVDD  | Digital Voltage Supply - should be 3.3V. Used for the PLL and the Oscillator Circuit   |
| IOVDD | Input/Output Pin Voltage. Also used as a source for the internal LDO for the digital circuit.  |
| LDO   | Output from the on-chip LDO. Should be used with a 0.1uF decoupling capacitor. Can be driven (used as power input) with a 1.8V supply to bypass the on-chip LDO for lower power consumption. |
| AGND  | Analog Ground  |
| DGND  | Digital Ground   |

### 10.2 1.8V Support

All PCM186x devices can support external devices with 1.8V IO. This is configured by driving IOVDD with 1.8V.

### 10.3 Power Up Sequence

The Power up sequence consists of the following steps

1. Power On Reset
  - (a) Power-up AVDD, DVDD and IOVDD
  - (b) Check if LDO is being driven with an external 1.8V, or is an output. Enable LDO if required.
  - (c) Release Digital Reset
2. Wait Until Analog Voltage Reference is stable
3. Configure Clock
4. Fade-IN Audio ADC Content

### 10.4 Lowest Power Down Modes

To achieve the lowest levels of power down and sleep current, the following recommended write sequences are suggested on PCM186x software programmable devices:

## Lowest Power Down Modes (continued)

### 10.4.1 Lowest Power In Standby (AVDD=DVDD=IOVDD=3.3V)

Consumption as low as 0.59mW

0x00=0x00 //select page0

0x70=0x14 //power down reference

0x00=0x03 //select page3

0x12=0x41 //disable OSC

0x00=0x00 //select page0

### 10.4.2 Lowest Power In Sleep/Energysense Mode (AVDD=DVDD=IOVDD=3.3V)

Consumption as low as 14mW

Clocks must be running during this process

0x00=0x00 //select page0

0x70=0x72 //enter in sleep mode

0x00=0xfd //select page253

0x14=0x10 //change global bias current

0x00=0x00 //select page0

Now stop the clocks

### 10.4.3 Lower Power In Sleep/Energysense Mode (AVDD=DVDD 3.3V and IOVDD=1.8V)

Consumption as low as 11.15mW

Clocks must be running during this process

0x00=0x00 //select page0

0x70=0x72 //enter in sleep mode

0x00=0xfd //select page253

0x14=0x10 //change global bias current

0x00=0x00 //select page0

stop the clocks (note: make sure the clock IO is 1.8V)

## 10.5 Power On Reset Sequencing Timing Diagram

Figure 61. Power On Reset Timing Diagram

## 10.6 Power Connection Examples

### 10.6.1 3.3V AVDD, DVDD and IOVDD

This is the most typical usage. One single supply, shared between all three supply voltage inputs. Rail-connected decoupling capacitors are not shown. Note; there is no disadvantage in separating the AVDD and DVDD, as the device will wait until both are present before powering up.

## Power Connection Examples (continued)

**Figure 62.** 3.3V for all supplies

**Figure 63.** Separate 3.3V for AVDD and DVDD

### 10.6.2 3.3V AVDD, DVDD with a 1.8V IOVDD for Lower Power Applications

The PCM186x also supports interfacing to lower power 1.8V processors. In the presence of an external 1.8V connected to LDO, the internal LDO that takes DVDD (3.3V) and converts it to the 1.8V core voltage is bypassed. Under such conditions, IOVDD will then be used as the 1.8V source for the digital core of the device. In such systems, it is still important to have 3.3V for DVDD, as specific sections of the digital core in the device run from 3.3V.

**Figure 64.** 1.8V IOVDD with 3.3V for AVDD and DVDD

## 10.7 Fade In

This is the final stage of the Power Up Sequence. Once the PLL has locked, The ADC will start running, and the data will follow the Fade-IN sequence according to the following steps:

1. Detect a zero crossing audio input.
2. Increment the volume towards 0dB with S-shaped volume.
3. Repeat from (1) until arrive at the 0dB. The number of steps from mute to 0dB is 48 steps.
4. If zero crossing does not occur for 8192 sample times (= time out), change the volume per sample time.

## Fade In (continued)

**Figure 65. S-Curve Fade-In Behavior**

## 11 Layout

### 11.1 PCM186x Grounding and System Partitioning

Designers should try to use the same ground between AGND and DGND to avoid any potential voltage difference between them. On the PCM186x EVM, we achieve up to 110dB SNR using a single ground plane, and ensuring that the return currents for digital signals do not go near the AGND pin or the input signals. Avoid running high frequency clock and control signals near AGND, or any of the VIN pins where possible.

The pin layout of the PCM186x partitions into two parts - analog section and digital section. Providing the system is partitioned in such a way that digital signals are routed away from the analog sections, then no digital return currents (for example, clocks) should be generated in the analog circuitry.

**Figure 66. Single Ground with Analog Partitioned to the top, Digital at the bottom**

With this in mind, when we laid out the EVM, we made sure that any digital return currents had a ground plane to their source/destination that didn't require passing below any analog circuitry. shown in [Figure 67](#)

## **PCM186x Grounding and System Partitioning (continued)**

**Figure 67. PCM186x EVM signal partitioning**

## 12 Programming and Registers Reference

### 12.1 Coefficient Data Formats

All mixer gain coefficients are 24-bit coefficients using a 4.20 number format. Numbers formatted as 4.20 numbers have 4 bits to the left of the binary point and 20 bits to the right of the binary point. If the most significant bit is logic 0, the number is a positive number. If the most significant bit is a logic 1, then the number is a negative number. In this case, every bit must be inverted, a 1 added to the result. See [SLAC663](#).

### 12.2 Register Map

The register map is the primary way to configure the PCM186x software programmable devices. The register map is separated into four pages (Page 0, 1, 3 and 253). Page 0 handles all of the device configuration whilst Page 1 is used to indirectly program coefficients into the two fixed function DSPs on the IC. Page 3 contains some additional registers for lower power usage along with Page 253. All undocumented registers should be considered reserved and should not be written.

Changing between pages is done by writing to register 0x00 with the page that you want.

Resetting registers is done by writing 0xFF to register 0x00.

#### 12.2.1 Register Map Summary

**Register Map Summary**

| Page 0 |      |                   |                   |                   |                   |                 |                 |                 |                 |
|--------|------|-------------------|-------------------|-------------------|-------------------|-----------------|-----------------|-----------------|-----------------|

## 12.3 Programming DSP Coefficients

The two fixed function DSPs on chip can have coefficients for filters and mixers programmed to them. This is done indirectly using specific registers on Page 1 (see Register map)

The internal DSP coefficient memory space is mapped as follows:

**Table 25. Virtual 24bit DSP Coefficient Registers**

|         | Coefficient | Address | Description |
|---------|-------------|---------|-------------|
| Mixer-1 | MIX1_CH1L   | 0x00    | 4.20 Format |
|         | MIX1_CH1R   | 0x01    |             |
|         | MIX1_CH2L   | 0x02    |             |
|         | MIX1_CH2R   | 0x03    |             |
|         | MIX1_I2SL   | 0x04    |             |
|         | MIX1_I2SR   | 0x05    |             |
| Mixer-2 | MIX2_CH1L   | 0x06    |             |
|         | MIX2_CH1R   | 0x07    |             |
|         | MIX2_CH2L   | 0x08    |             |
|         | MIX2_CH2R   | 0x09    |             |
|         | MIX2_I2SL   | 0x0A    |             |
|         | MIX2_I2SR   | 0x0B    |             |
| Mixer-3 | MIX3_CH1L   | 0x0C    |             |
|         | MIX3_CH1R   | 0x0D    |             |

## Programming DSP Coefficients (continued)

**Table 25. Virtual 24bit DSP Coefficient Registers (continued)**

|                      | Coefficient      | Address | Description |
|----------------------|------------------|---------|-------------|
|                      | MIX3_CH2L        | 0x0E    |             |
|                      | MIX3_CH2R        | 0x0F    |             |
|                      | MIX3_I2SL        | 0x10    |             |
|                      | MIX3_I2SR        | 0x11    |             |
| Mixer-4              | MIX4_CH1L        | 0x12    |             |
|                      | MIX4_CH1R        | 0x13    |             |
|                      | MIX4_CH2L        | 0x14    |             |
|                      | MIX4_CH2R        | 0x15    |             |
|                      | MIX4_I2SL        | 0x16    |             |
|                      | MIX4_I2SR        | 0x17    |             |
| Secondary ADCLPF/HPF | LPF_B0           | 0x20    | 1.23 Format |
| Coefficients         | LPF_B1           | 0x21    |             |
|                      | LPF_B2           | 0x22    |             |
|                      | LPF_A1           | 0x23    |             |
|                      | LPF_A2           | 0x24    |             |
|                      | HPF_B0           | 0x25    |             |
|                      | HPF_B1           | 0x26    |             |
|                      | HPF_B2           | 0x27    |             |
|                      | HPF_A1           | 0x28    |             |
|                      | HPF_A2           | 0x29    |             |
| Energysense          | Loss_threshold   | 0x2C    | 1.23 Format |
| Energysense          | Resume_threshold | 0x2D    |             |

A great example of how to write to these registers is shown below

For example, change the Energysense resume threshold value to -30 dB (0x040C37)

Write 0x00 0x01 ; # change to register bank 1

Write 0x02 0x2D ; # write the memory address of resume threshold

Write 0x04 0x04 ; # bit[23:15]

Write 0x05 0x0C ; # bit[15:8]

Write 0x06 0x37 ; # bit[7:0]

Write 0x01 0x01 ; # execute write operation

## 13 Device and Documentation Support

### 13.1 Development Support

See [The PCM186xEVM User Guide, SLAU559](#)

### 13.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 26. Related Links**

| PARTS   | PRODUCT FOLDER             | SAMPLE & BUY               | TECHNICAL DOCUMENTS        | TOOLS & SOFTWARE           | SUPPORT & COMMUNITY        |
|---------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|

### 13.3 Trademarks

Bluetooth is a registered trademark of Bluetooth SIG, Inc..  
All other trademarks are the property of their respective owners.

### 13.4 Electrostatic Discharge Caution

-  This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.  
 ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 13.5 Glossary

[SLYZ022 — TI Glossary](#).

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following packaging information and addendum reflect the most current data available for the designated devices. This data is subject to change without notice and revision of this document.

**PACKAGING INFORMATION**

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

www.ti.com

## PACKAGE OPTION ADDENDUM

24-May-2014

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### REEL DIMENSIONS

### TAPE DIMENSIONS

|    |   |
|----|---|

## MECHANICAL DATA

DBT (R-PDSO-G30)

PLASTIC SMALL OUTLINE

4073252-5/I 03/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion.
  - D. Falls within JEDEC MO-153.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

| <b>Products</b>              | <b>Applications</b>  |  |  |
|------------------------------|--|--|--|
